Dates of Miscellaneous Phenomena

Auroras.— 1st, 22d, 30th.

Halos, lunar.— 7th.

Halos, Solar.—7th, 18th, 20th, 21st, 24th, 25th, 30th.

Hail. — None.

Thunderstorms. — None.

Fog, dense.— 2-4th, 8-13th, 16th, 19-22d, 25-27th.

Frosts. — Killing frost penetrated sheltered and less susceptible places along southern New England coast (except Nantucket and Block Island) on 6th, 13th, 14th, 16th and 30th, progressively depending upon susceptibility of location. (Elsewhere in Section, killing frost earlier in season.)

Sleet. —(State, date, number of stations reporting)—Maine: 2d, 3; 3d, 1; 4th, 1; 5th, 1; 9th, 1; 22d, 1; 25th, 1. New Hampshire: 2d, 3; 14th, 3; 27th, 1. Vermont: 2d, 1; 4th, 1; 14th, 3; 29th, 1. Massachusetts: 14th, 2. Rhode Island: None. Connecticut: 14th, 1; 15th, 1; 28th, 1.

Solar Eclipse, partial, on 23d.

Tenths of daily total radiation considered in average.

EXPLANATION OF REFERENCE MARKS

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observations. Maximum and minimum temperatures recorded at this time are nearly always correct for the date on which they are recorded. The departures from the normal temperature and precipitation are computed from the averages of the entire period through 1940 for stations having 10 or more years of record. Reference letters [a], [b], [c], etc. appearing in the table indicate number of days missing; for example, [b] represents two days, etc.

† Post-office addresses of these stations are as follows: Maine — Brassua Dam, Rockwood; Hiram, West Baldwin; Ripogenus Dam, Millinocket; Winslow, Waterville; — New Hampshire — First Connecticut Lake, Pittsburg; New Durham, Alton; Pinkham Notch, Gorham; York Pond, Berlin; — Vermont — Bloomfield, North Stratford, N. H.; Cornwall, Middlebury; Mays Mill, Colrain, Mass.; Searsburg Station, Wilmington; Somerset, Wilmington; Vernon, Shelburne Falls, Mass.; — Massachusetts — Ashland, Framingham; Blue Hill, Milton; Lake Cochituate, Framingham; — Connecticut — Cream Hill, West Cornwall; Middletown, Rockfall.

†† Not included in summaries. ††† Observer for New England Power Co. T Trace, precipitation is less than .01 inch rain or melted snow.

* Precipitation included in that of next measurement. ** Record furnished by Massachusetts Department of Public Health; precipitation measured in morning.

‖ Observations taken in morning; maximum then read is charged to preceding day on which it almost always occurs. § Also on other dates recorded as of preceding date. ‡ Precipitation measured with recording gage. ‡‡ Observation taken at 1.30 a. m., recorded as of preceding day.

[1] Regular Weather Bureau station; precipitation and temperature are for 24 hour period, midnight to midnight. [2] Precipitation measured in morning; amount recorded is for preceding 24 hours (ending on date entered). [3] Thermometers not supplied by Weather Bureau. [4] Precipitation measured in morning recorded as of preceding date. [5]Observations irregular.

Daily Precipitation for November 1946

VOL. LVIII. BOSTON, MASS., DECEMBER 1946. NO. 12.

GENERAL SUMMARY

December, 1946, in New England was the 4th consecutive month of above normal temperature. Although the periods of above normal and subnormal temperature were about equally divided through the month, the excess of temperature was largely accounted for by a spell of unusual warmth from the 7th through the 13th. In Boston, the daily average temperature excess during that period was more than 13°. Total monthly amounts of precipitation ranged from more than 50 percent above normal in Vermont to nearly 30 percent below normal in Connecticut, with an overall Sectional average of about 13 percent above normal. Frequency of precipitation varied considerably between the two divisions of the Section, with an average of 15 days with measurable amounts in the northern division, and 8 in the southern. Heavy snowfalls in the northern division on the 20-21st and on the 27-28th accounted for a near record volume for December. Total accumulation amounting to about 26.5 inches was, with one exception in 1933, the greatest since 1893. In the southern division, with much of the precipitation occurring as rain or freezing rain, total accumulation of snow was fractionally subnormal. The lack of an adequate snow cover until late in the month delayed seasonal activities in the winter resort areas of the northern division until about the 27-28th. At the close of the month, depth of snow cover ranged as follows: In the southern division, from bare ground along the extreme southern margins and Cape Cod to about 10 inches along the northern Massachusetts boundary; in the northern division, from about 4 inches along the eastern Maine coast to about 25 inches in central and north-central portions of the division.

TEMPERATURE

The average monthly temperature for the Section, based on 115 records, was 27.6°, which is 1.2° above the mean for the past 59 years. The average temperature for the northern division was 23.1°; for the southern division, 32.1°. The highest monthly mean was 39.0° at New Bedford, Mass.; the lowest was 13.2° at Caribou, Me. The highest recorded was 70° at Waterbury, Conn. on the 10th; the lowest was −23° at Caribou, Me. on the 29th, and Fort Kent, Me. on the 30th. The greatest monthly range was 80° at Woodstock, Vt.; the least was 45° at Nantucket, Mass.

PRECIPITATION

The average monthly precipitation for the Section, based on 186 records, was 3.76 inches, which is 0.42 inch above the mean for the past 59 years. The average precipitation for the northern division was 4.09 inches; for the southern division, 3.44 inches. The greatest monthly amount reported was 6.78 inches at Searsburg Station, Vt.; the least was 1.43 inches at Salisbury, Conn. The greatest amount in 24 hours was 3.10 inches at Spot Pond, Mass. on the 20-21st. The average number of days with .01 inch or more of precipitation was 12, which is 2 above the mean for the past 59 years.

The average snowfall for the northern division, based on 83 records, was 26.5 inches; for the southern division, based on 86 records, 7.4 inches; for the Section, based on 169 records, 16.8 inches, which is 5.6 inches above the mean for the past 59 years.

WIND, SUNSHINE, CLOUDINESS, AND HUMIDITY

The prevailing direction of the wind, based on 135 records, was northwest. The average velocity, based on the records at 14 stations, was 10.8 miles per hour, which is 0.1 mile per hour below the mean.

The sunshine, based on the records at 12 stations, averaged 44 percent of the possible amount, which is the mean.

Cloudiness was slightly above the mean. The average for the Section, based on 141 records, was 8 clear, 9 partly cloudy and 14 cloudy days.

The monthly relative humidity, based on the 7:30 a. m. and 7:30 p. m. observations at 14 stations, was 75 percent, which is 2 percent below the mean.

Tenths of daily total radiation considered in average.

EXPLANATION OF REFERENCE MARKS

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observations. Maximum and minimum temperatures recorded at this time are nearly always correct for the date on which they are recorded. The departures from the normal temperature and precipitation are computed from the averages of the entire period through 1940 for stations having 10 or more years of record. Reference letters ^{a},^{b},^{c}, etc. appearing in the table indicate number of days missing: for example, ^{b} represents two days, etc.

† Post-office addresses of these stations are as follows: Maine — Brassua Dam, Rockwood; Hiram, West Baldwin; Ripogenus Dam, Millinocket; Winslow, Waterville; — New Hampshire — First Connecticut Lake, Pittsburg; New Durham, Alton; Pinkham Notch, Gorham; York Pond, Berlin; — Vermont — Bloomfield, North Stratford, N. H.; Cornwall, Middlebury; Mays Mill, Colrain, Mass.; Searsburg Station, Wilmington; Somerset, Wilmington; Vernon, Shelburne Falls, Mass.; — Massachusetts — Ashland, Framingham; Blue Hill, Milton; Lake Cochituate, Framingham; — Connecticut — Cream Hill, West Cornwall; Middletown, Rockfall.

‖ Not included in summaries. †† Observer for New England Power Co. T. Trace, precipitation is less than .01 inch rain or melted snow.

* Precipitation included in that of next measurement. ** Record furnished by Massachusetts Department of Public Health; precipitation measured in morning recorded as of preceding date.

Observations taken in morning: maximum then read is charged to preceding day on which it almost always occurs. § Also on other dates.

‡ Precipitation measured with recording gage. ‡‡ Observation taken at 1.30 a. m., recorded as of preceding day.

[1] Regular Weather Bureau station; precipitation and temperature are for 24 hour period, midnight to midnight. [2] Precipitation measured in morning; amount recorded is for preceding 24 hours (ending on date entered). [3] Thermometers not supplied by Weather Bureau. [4] Precipitation measured in morning recorded as of preceding date. [5] Observations irregular.

Daily Precipitation for December 1946

VOL. LVIII. BOSTON, MASS., ANNUAL, 1946. No. 13.

GENERAL SUMMARY.

During the first two months of 1946 in New England, the weather was somewhat typical of middle and late winter. Despite the occurrence of an extended mild period, generally referred to as the "January thaw", from January 4th to the 13th, the average temperature for these two months was slightly subnormal. Total volume of snow was generally above normal, particularly in the northern division, and at the end of February, depth of snow cover ranged from 2 to 16 inches in the southern division, and to 35 inches or more in the northern division. Major contributions to the total volume of snow were made by storms on January 20th-21st and 24-25th, and February 19-20th. March weather paralleled to an extraordinary extent the record warmth of March, 1945, and even exceeded the record of that month by nearly a degree. In Boston, Providence, and a number of other stations, the mean monthly temperature was actually higher than the normal for April, and the mean monthly temperature for Massachusetts was indeed higher than that of the April which followed, an anomaly never before recorded. Temperature of 87° on the 29th at Durham, N. H. established an all-time record high reading for March in the northern division. The substantial snow cover which existed at the beginning of the month was practically eliminated by mid-month over southern and central areas, and at the close of the month the only snow remaining was on northern slopes and woods in extreme northern districts. Average total snowfall of 1.0 inch in the northern division was the least ever recorded there in March. The threat of floods was largely erased by the middle of the month, while the unseasonable warmth produced an agricultural advance of about three weeks ahead of season. Beginning with April and until the end of August, cool weather very definitely predominated, and during those five

(Continued on page 102)

The average annual mean temperature for the Section was 46.8°, which is 0.9° above the mean for the past 59 years. The average temperature for the northern division was 44.0°; for the southern division 49.6°. The highest annual mean temperature was 52.7° at Providence, R. I.; the lowest was 38.1° at Caribou, Me. The highest temperature reported was 99° at several stations on July 19 and 20; the lowest was −32° at Fort Kent, Me., on January 15 and at First Connecticut Lake, N. H., on February 5. The annual range for New England was 131°; the greatest local annual range was 125° at Lemington, Vt.; the least local annual range was 72° at Nantucket, Mass.

The average annual precipitation for the Section was 39.55 inches, which is 2.49 inches below the mean for the past 59 years. The average precipitation for the northern division was 38.98 inches; for the southern division 40.13 inches. The average annual snowfall for the northern division was 85.6 inches; for the southern division 37.9 inches; and for the Section, 61.9 inches, which is 1.8 inches below the mean for the past 59 years. The greatest annual precipitation was 56.55 inches at Pinkham Notch, N. H.; the least annual amount was 28.66 inches at Lebanon, N. H. The greatest local monthly amount was 17.85 inches at Sandwich, Mass. in August; the least local monthly amount was 0.16 inch at Providence, R. I., in October. The greatest amount in any 24 hours was 6.93 inches at Wood River Junction, R. I., on August 7, 1946. The average number of days with .01 inch or more of precipitation was 121, which is 1 below the mean for the past 59 years.

The prevailing direction of the wind was northwest. The average velocity was 9.3 miles per hour, which is 0.7 mile per hour below the mean. The maximum velocity recorded during the year was 76 miles per hour from the northwest on June 8 at Blue Hill, Mass.

Sunshine averaged 55% of the possible amount, which is 1 percent above the mean for the past 53 years. Cloudiness was slightly above the mean; the average for the Section was 135 clear; 98 partly cloudy and 132 cloudy days.

COMPARATIVE DATA (Northern: Maine, New Hampshire, and Vermont; Southern: Massachusetts, Rhode Island, and Connecticut).

(Continued from page 97)

months there was but one noteworthy extended period of above normal warmth, occurring during the last week of June. Agriculture was further unfavorably affected by inadequate sunshine in April, excessive rainfall in May and early June, followed by an increasing dearth of rainfall which reached near-drought proportions by mid-July. Widespread agricultural damage resulted, with crops stunted and fields and pastures browned. Moderate to heavy rainfall from July 21st to the 23d produced sufficient soil moisture to begin agricultural recovery which was further aided by additional rainfall near the end of the month. An outstanding feature of June's weather was the unusually violent and destructive thunderstorm activity which occurred during the evening of the 8th over the southern division. Many trees and wires were downed; hail damage to shade coverings for tobacco and to cranberry vines was reported; and many windows were broken by hail and winds which exceeded 50 miles per hour in gusts. August brought the heaviest rainfall of the year to nearly all portions of the Section. New all-time record high monthly totals were reported from a number of stations in southeastern Massachusetts. Greatest monthly amounts were recorded at Sandwich, Mass., 17.85 inches, and at Fall River, Mass., 16.10 inches. Frequent heavy rains produced floods of varying extent and damage during the month, the most serious being those of the 7th and 26-27th. That of the 7th occurred at many localities of southeastern Massachusetts and Rhode Island; on the 26-27th, the inundated area extended along the Maine coast from York Harbor to Wells. The months from September through November provided fall weather of such excellence as has seldom, if ever, been equalled in New England. A day-long heavy rainstorm on September 30th over practically the entire Section, and an unusually heavy early season snowstorm on October 1st and 2d in the mountains of Vermont were the major detractions from the near ideal weather during that period. Each of the three months was substantially warmer than normal, with regular succession of extended periods of above normal warmth. The most outstanding of these was the period from October 25th through October 31st. Above normal warmth continued to predominate until well into December when cold polar air overspread the Section on the 26th and controlled conditions to the end of the month. On December 31st, depth of snow cover over the Section ranged as follows: In the southern division, from bare ground over extreme southern margins and Cape Cod to about 10 inches along the northern Massachusetts boundary; in the northern division, from about 4 inches along the eastern Maine coast to about 25 inches in central and north-central portions of the division.

VOL. LIX. BOSTON, MASS., JANUARY 1947. No. 1.

GENERAL SUMMARY

January, 1947, was the fifth consecutive month of above normal temperature in New England. The average temperature during the first 23 days of the month was close to normal, with the number of days of above normal and subnormal temperature about equally divided. On the 24th, there began an extended period of warmth considerably above normal, commonly referred to as the "January thaw", which continued to the end of the month. This eliminated the rather light snow cover, which existed on the 23d, over most of the southern division, and reduced the cover elsewhere. Monthly maximum temperatures occurred generally on the 28th and 31st, with readings reaching the upper 50's and lower 60's in the southern division, and the lower 50's in the northern division. During the evening of the 30th, a sudden influx of warm air over Connecticut and the Southeast produced an unusually rapid rise in temperature, which amounted to 20° in less than an hour at Boston and Hartford. A greater than normal proportion of monthly precipitation occurred as rain or freezing rain, so that the total volume of snow throughout the Section was much less than normal, despite a slight excess of precipitation in the northern division and only a moderate deficiency in the southern division. At the close of the month, the ground was bare over almost all of the southern division except for a light cover in parts of the Connecticut Valley and in the Berkshires where depths ranged up to 12 inches; in the northern division, snow depth ranged from traces along the eastern Maine coast and 2 to 5 inches in the Champlain Valley to more than 20 inches in some of the higher elevations. E. S.

TEMPERATURE

The average monthly temperature for the Section, based on 115 records, was 24.8°, which is 2.4° above the mean for the past 60 years. The average temperature for the northern division was 19.2°; for the southern division, 30.6°. The highest monthly mean was 37.4° at New Bedford, Mass.; the lowest was 8.5° at Caribou, Me. The highest recorded was 63° at Providence, R. I. on the 28th, and Plymouth (North), Mass. on the 31st; the lowest was −32° at Fort Kent, Me. on the 4th. The greatest monthly range was 79° at Woodland, Me.; the least was 40° at Block Island, R. I.

PRECIPITATION

The average monthly precipitation for the Section, based on 187 records, was 3.24 inches, which is 0.17 inch below the mean for the past 60 years. The average precipitation for the northern division was 3.42 inches; for the southern division, 3.08 inches. The greatest monthly amount reported was 5.57 inches at Searsburg Station, Vt.; the least was 1.74 inches at Brassua Dam and Presque Isle, Me. The greatest amount in 24 hours was 2.43 inches at Hatchville, Mass. on the 20th. The average number of days with .01 inch or more of precipitation was 13, which is 2 above the mean for the past 60 years.

The average snowfall for the northern division, based on 86 records, was 14.2 inches; for the southern division, based on 87 records, 6.1 inches; for the Section, based on 173 records, 10.1 inches, which is 5.5 inches below the mean for the past 60 years.

WIND, SUNSHINE, CLOUDINESS, AND HUMIDITY

The prevailing direction of the wind, based on 133 records, was northwest. The average velocity, based on the records at 14 stations, was 10.3 miles per hour, which is 0.7 mile per hour below the mean.

The sunshine, based on the records at 11 stations, averaged 45 percent of the possible amount, which is 2 percent below the mean.

Cloudiness was slightly above the mean. The average for the Section, based on 140 records, was 9 clear, 8 partly cloudy and 14 cloudy days.

The monthly relative humidity, based on the 7:30 a. m. and 7:30 p. m. observations at 13 stations, was 79 percent, which is 2 percent above the mean.

COMPARATIVE DATA (Northern: Maine, New Hampshire, and Vermont; Southern: Massachusetts, Rhode Island, and Connecticut.)

Tenths of daily total radiation considered in average.

EXPLANATION OF REFERENCE MARKS

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observations. Maximum and minimum temperatures recorded at this time are nearly always correct for the date on which they are recorded. The departures from the normal temperature and precipitation are computed from the averages of the entire period through 1940 for stations having 10 or more years of record. Reference letters [a],[b],[c], etc. appearing in the table indicate number of days missing; for example, [b] represents two days, etc.

† Post-office addresses of these stations are as follows: Maine — Brassua Dam, Rockwood; Hiram, West Baldwin; Ripogenus Dam, Millinocket; Winslow, Waterville; — New Hampshire — First Connecticut Lake, Pittsburg; New Durham, Alton; Pinkham Notch, Gorham; York Pond, Berlin; — Vermont — Bloomfield, North Stratford, N. H.; Cornwall, Middlebury; Mays Mill, Colrain, Mass.; Searsburg Station, Wilmington; Somerset, Wilmington; Vernon, Shelburne Falls, Mass.; — Massachusetts — Ashland, Framingham; Blue Hill, Milton; Lake Cochituate, Framingham; — Connecticut — Cream Hill, West Cornwall; Middletown, Rockfall.

†† Not included in summaries ‡‡‡ Observer for New England Power Co. T. Trace, precipitation is less than .01 inch rain or melted snow.

* Precipitation included in that of next measurement. ** Record furnished by Massachusetts Department of Public Health: precipitation measured in morning recorded as of preceding date.

‖ Observations taken in morning; maximum then read is charged to preceding day on which it almost always occurs. § Also on other dates.

‡ Precipitation measured with recording gage. ‡‡ Observation taken at 1.30 a. m., recorded as of preceding day.

[1] Regular Weather Bureau station; precipitation and temperature are for 24 hour period, midnight to midnight. [2] Precipitation measured in morning; amount recorded is for preceding 24 hours (ending on date entered). [3] Thermometers not supplied by Weather Bureau. [4] Precipitation measured in morning recorded as of preceding date. [5] Observations irregular.

Daily Precipitation for January 1947

VOL. LIX. BOSTON, MASS., FEBRUARY 1947. No. 2.

GENERAL SUMMARY

February, 1947, in New England marked the 6th consecutive month of above-normal temperature for the Section as a whole, although the departure from normal (0.7°) was less than that of any of the 5 preceding months. Subnormal average monthly temperatures were recorded over a considerable area which included nearly all of Connecticut and the region west of the Connecticut River excepting central Vermont. Greatest positive temperature departures were recorded over central and eastern Maine, with maximum at Houlton, +7.6°. A comparison of mean monthly temperatures at the stations of greatest positive and negative departures reveals a very unusual temperature pattern: Houlton, Me., which is normally 3.5° colder than Newport, Vt. in February, was actually 7.5° warmer this month. The causes of this unusual temperature pattern may be attributed to the deceleration of the cold front on several occasions after it had passed over western portions of the Section, and to increased marine influence over central and eastern Maine. The monthly volume of snowfall was above normal in nearly all parts of the Section, although eastern and southern portions of the southern division had bare ground much of the time until the 20th. The snowstorm of the 20-21st was generally the heaviest of the season with amounts ranging from about 8 to 16 inches or more. At the close of the month, the snow cover ranged as follows: In the southern division, from traces at some places along the immediate coast to about 8 inches, and to 20 inches in the Berkshires and northwestern Connecticut; in the northern division, from about 5 inches along the southern Maine coast to more than 15 inches at many places, and to more than 40 inches at some extreme northern stations and in the higher elevations. Total monthly precipitation was considerably below normal in the southern division, and near normal in the northern division.

E. S.

TEMPERATURE

The average monthly temperature for the Section, based on 124 records, was 23.3°, which is 0.7° above the mean for the past 60 years. The average temperature for the northern division was 20.2°; for the southern division, 26.6°. The highest monthly mean was 31.0° at Hyannis, Mass.; the lowest was 9.8° at First Connecticut Lake, N. H. The highest recorded was 56° at Plymouth (North), Mass. on the 1st, and Providence, R. I. on the 18th; the lowest was −25° at Enosburg Falls, Vt. on the 20th. The greatest monthly range was 68° at Enosburg Falls, Vt.; the least was 38° at Nantucket, Mass., Block Island, R. I. and New Haven, Conn.

PRECIPITATION

The average monthly precipitation for the Section, based on 195 records, was 2.48 inches, which is 0.58 inch below the mean for the past 60 years. The average precipitation for the northern division was 2.83 inches; for the southern division, 2.14 inches. The greatest monthly amount reported was 6.37 inches at Greenville, Me.; the least was 0.56 inch at Middletown, R. I. The greatest amount in 24 hours was 3.18 inches at Greenville, Me. on the 4-5th. The average number of days with .01 inch or more of precipitation was 8, which is 1 below the mean for the past 60 years.

The average snowfall for the northern division, based on 88 records, was 24.0 inches; for the southern division, based on 91 records, 17.0 inches; for the Section, based on 179 records, 20.4 inches, which is 3.9 inches above the mean for the past 60 years.

WIND, SUNSHINE, CLOUDINESS, AND HUMIDITY

The prevailing direction of the wind, based on 142 records, was northwest. The average velocity, based on the records at 14 stations, was 12.3 miles per hour, which is 0.6 mile per hour above the mean.

The sunshine, based on the records at 12 stations, averaged 55 percent of the possible amount, which is 4 percent above the mean.

Cloudiness was somewhat above the mean. The average for the Section, based on 147 records, was 9 clear, 7 partly cloudy and 12 cloudy days.

The monthly relative humidity, based on the 7:30 a. m. and 7:30 p. m. observations at 14 stations, was 73 percent, which is 2 percent below the mean.

COMPARATIVE DATA (**Northern: Maine, New Hampshire, and Vermont; Southern: Massachusetts, Rhode Island, and Connecticut**).

Tenths of daily total radiation considered in average.

EXPLANATION OF REFERENCE MARKS

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observations. Maximum and minimum temperatures recorded at this time are nearly always correct for the date on which they are recorded. The departures from the normal temperature and precipitation are computed from the averages of the entire period through 1940 for stations having 10 or more years of record. Reference letters ^{a},^{b},^{c}, etc. appearing in the table indicate number of days missing; for example, ^{b} represents two days, etc.

† Post-office addresses of these stations are as follows: Maine — Brassua Dam, Rockwood; Hiram, West Baldwin; Ripogenus Dam, Millinocket; Winslow, Waterville; — New Hampshire — First Connecticut Lake, Pittsburg; New Durham, Alton; Pinkham Notch, Gorham; York Pond, Berlin; — Vermont — Bloomfield, North Stratford, N. H.; Cornwall, Middlebury; Mays Mill, Colrain, Mass.; Searsburg Station, Wilmington; Somerset, Wilmington; Vernon, Shelburne Falls, Mass.; — Massachusetts — Ashland, Framingham; Blue Hill, Milton; Lake Cochituate, Framingham; — Connecticut — Cream Hill, West Cornwall; Middletown, Rockfall.

†† Not included in summaries ††† Observer for New England Power Co. T. Trace, precipitation is less than .01 inch rain or melted snow.

* Precipitation included in that of next measurement. ** Record furnished by Massachusetts Department of Public Health; precipitation measured in morning recorded as of preceding date.

‖ Observations taken in morning; maximum then read is charged to preceding day on which it almost always occurs. § Also on other dates.

‡ Precipitation measured with recording gage. ‡‡ Observation taken at 1.30 a. m., recorded as of preceding day.

[1] Regular Weather Bureau station; precipitation and temperature are for 24 hour period, midnight to midnight. [2] Precipitation measured in morning; amount recorded is for preceding 24 hours (ending on date entered). [3] Thermometers not supplied by Weather Bureau. [4] Precipitation measured in morning recorded as of preceding date. [5] Observations irregular.

VOL. LIX. BOSTON, MASS., MARCH 1947. NO. 3.

GENERAL SUMMARY

New England's weather during March, 1947, was featured by an unusually heavy fall of snow, of near record proportions, over the southern Green Mountain range of Vermont, northwestern Massachusetts and the Berkshires. The storm, which enveloped the entire Section during the 2d, brought heavy rain or rain mixed with snow over most of the southern division, except in the above-mentioned areas of heavy snow, and over southern portions of Maine and New Hampshire. Elsewhere in the northern division, snowfall amounts were generally moderately heavy. The storm ended in most sections on the 3d, but in Vermont and western Massachusetts it continued until the evening of the 5th. Maximum depth of snow deposited by the storm was 50 inches at Readsboro, Vt., where total accumulation of snow on the ground was 80 inches on the evening of the 5th. At Peru, Mass., 47 inches of new snow fell during the storm. Twenty-four hour snowfall amounts of 23 inches and 20 inches were recorded at Readsboro and Whitingham, Vt., respectively, on the 2-3d. Highway traffic in parts of these areas was either interrupted or stalled, and several small communities were isolated for two to four days. Northeast gales, attending the storm along the coast from Nantucket to southern Maine, caused heavy damage to summer residences, breakwaters and power lines, and a 10,000 ton freighter was lost as were several smaller craft. At the end of the month, the ground was bare, or nearly so, over southern portions of Maine and New Hampshire and the southern division except in the Berkshires bordering Vermont. Up to 40 inches of snow remained on the ground in the southern Green Mountain area and adjacent portions of Massachusetts, while elsewhere in the northern division, snow depths ranged from 1 to 2 inches on southern slopes to more than 20 inches in northwestern Maine. The average temperature for the month was a fraction of a degree below normal, this being the first month of subnormal temperature for the Section as a whole since August, 1946.

E. S.

TEMPERATURE

The average monthly temperature for the Section, based on 120 records, was 32.1°, which is 0.3° below the mean for the past 60 years. The average temperature for the northern division was 29.9°; for the southern division, 34.4°. The highest monthly mean was 38.4° at New Bedford, Mass. and Providence, R. I.; the lowest was 21.6° at First Connecticut Lake, N. H. The highest recorded was 61° at Lake Cochituate, Mass. on the 24th; the lowest was −19° at First Connecticut Lake, N. H. on the 1st. The greatest monthly range was 68° at First Connecticut Lake, N. H.; the least was 28° at Block Island, R. I.

PRECIPITATION

The average monthly precipitation for the Section, based on 192 records, was 3.23 inches, which is 0.38 inch below the mean for the past 60 years. The average precipitation for the northern division was 3.28 inches; for the southern division, 3.18 inches. The greatest monthly amount reported was 7.08 inches at Searsburg Station, Vt.; the least was 1.59 inches at McIndoe Falls, Vt. The greatest amount in 24 hours was 3.80 inches at Lake Cochituate, Mass. on the 2-3d. The average number of days with .01 inch or more of precipitation was 9, which is 2 below the mean for the past 60 years.

The average snowfall for the northern division, based on 87 records, was 17.5 inches; for the southern division, based on 91 records, 7.2 inches; for the Section, based on 178 records, 12.2 inches, which is 1.2 inches above the mean for the past 60 years.

WIND, SUNSHINE, CLOUDINESS, AND HUMIDITY

The prevailing direction of the wind, based on 137 records, was northwest. The average velocity, based on the records at 14 stations, was 10.7 miles per hour, which is 0.7 mile per hour below the mean.

The sunshine, based on the records at 12 stations, averaged 57 percent of the possible amount, which is 4 percent above the mean.

Cloudiness was slightly above the mean. The average for the Section, based on 142 records, was 10 clear, 9 partly cloudy and 12 cloudy days.

The monthly relative humidity, based on the 7:30 a. m. and 7:30 p. m. observations at 14 stations, was 74 percent, which is the mean.

COMPARATIVE DATA (Northern: Maine, New Hampshire, and Vermont; Southern: Massachusetts, Rhode Island, and Connecticut).

Tenths of daily total radiation considered in average.

EXPLANATION OF REFERENCE MARKS

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observations. Maximum and minimum temperatures recorded at this time are nearly always correct for the date on which they are recorded. The departures from the normal temperature and precipitation are computed from the averages of the entire period through 1940 for stations having 10 or more years of record. Reference letters ^{a},^{b},^{c}, etc. appearing in the table indicate number of days missing; for example, ^{b} represents two days, etc.

† Post-office addresses of these stations are as follows: Maine — Brassua Dam, Rockwood; Hiram, West Baldwin; Ripogenus Dam, Millinocket; Winslow, Waterville; — New Hampshire — First Connecticut Lake, Pittsburg; New Durham, Alton; Pinkham Notch, Gorham; York Pond, Berlin; — Vermont — Bloomfield, North Stratford, N. H; Cornwall, Middlebury; Mays Mill, Colrain, Mass.; Searsburg Station, Wilmington; Somerset, Wilmington; Vernon, Shelburne Falls, Mass.; — Massachusetts — Ashland, Framingham; Blue Hill, Milton; Lake Cochituate, Framingham; — Connecticut — Cream Hill, West Cornwall; Middletown, Rockfall.

†† Not included in summaries. ††† Observer for New England Power Co. T. Trace, precipitation is less than .01 inch rain or melted snow.

* Precipitation included in that of next measurement. ** Record furnished by Massachusetts Department of Public Health; precipitation measured in morning recorded as of preceding date.

‖ Observations taken in morning; maximum then read is charged to preceding day on which it almost always occurs. § Also on other dates.

‡ Precipitation measured with recording gage. ‡‡ Observation taken at 1.30 a. m., recorded as of preceding day.

[1] Regular Weather Bureau station; precipitation and temperature are for 24 hour period, midnight to midnight. [2] Precipitation measured in morning; amount recorded is for preceding 24 hours (ending on date entered). [3] Thermometers not supplied by Weather Bureau. [4] Precipitation measured in morning recorded as of preceding date. [5] Observations irregular.

Daily Precipitation for March 1947

VOL. LIX. BOSTON, MASS., APRIL 1947. No. 4.

GENERAL SUMMARY

Inadequate sunshine and warmth, and too wet soil in the southern division, retarded growth of vegetation and generally delayed plowing and soil preparation. There were frequent occurrences of heavy frost until near the end of the month in nearly all portions of the Section. In Boston, killing frost occurred on the 28th, which is 11 days later than the average date of last killing frost in the spring. At the end of the month, the growing season was estimated to be about two weeks late. The first half of the month was warmer than normal, with moderately high temperatures on the 6th, 11th and 12th. Cold weather, with frequent subfreezing readings, predominated with unusual persistence during the latter half of the month. In Maine, monthly minima were recorded generally on the 29th with lowest reading of zero at Fort Kent on that date. Rainfall was rather unevenly distributed between the two divisions of the Section. In the northern division, the average monthly total was 2.41 inches as against 4.63 inches in the southern division. Frequency of precipitation occurrence was only slightly greater, however, in the southern division, averaging 13 days there, and 12 days in the northern division. The deep snow cover which existed at the end of March in the southern Green Mountain area was mostly gone before mid-month, and the snow cover then remaining in the Section was confined to woods and mountain ravines in the northern division. A moderate to heavy snowstorm occurred over central New England on the 20-21st, with amounts ranging from about 3 to 15 inches. This snow cover disappeared within a day or two. E. S.

TEMPERATURE

The average monthly temperature for the Section, based on 121 records, was 42.2°, which is 1.4° below the mean for the past 60 years. The average temperature for the northern division was 39.2°; for the southern division, 45.2°. The highest monthly mean was 49.2° at Chestnut Hill, Mass.; the lowest was 29.1° at Caribou, Me. The highest recorded was 81° at Waterbury, Conn. on the 12th; the lowest was 0° at Fort Kent, Me. on the 29th. The greatest monthly range was 66° at Woodstock, N. H.; the least was 26° at Block Island, R. I.

PRECIPITATION

The average monthly precipitation for the Section, based on 194 records, was 3.57 inches, which is 0.23 inch above the mean for the past 60 years. The average precipitation for the northern division was 2.41 inches; for the southern division, 4.63 inches. The greatest monthly amount reported was 7.89 inches at Edgartown, Mass.; the least was 0.75 inch at Essex Junction, Vt. The greatest amount in 24 hours was 2.02 inches at New Haven, Conn. on the 2-3d. The average number of days with .01 inch or more of precipitation was 13, which is 3 above the mean for the past 60 years.

The average snowfall for the northern division, based on 88 records, was 7.0 inches; for the southern division, based on 92 records, 2.4 inches; for the Section, based on 180 records, 4.6 inches, which is 0.5 inch above the mean for the past 60 years.

WIND, SUNSHINE, CLOUDINESS, AND HUMIDITY

The prevailing direction of the wind, based on 138 records, was southwest. The average velocity, based on the records at 14 stations, was 11.1 miles per hour, which is 0.3 mile per hour above the mean.

The sunshine, based on the records at 13 stations, averaged 49 percent of the possible amount, which is 5 percent below the mean.

Cloudiness was somewhat above the mean. The average for the Section, based on 144 records, was 9 clear, 8 partly cloudy and 13 cloudy days.

The monthly relative humidity, based on the 7:30 a. m. and 7:30 p. m. observations at 13 stations, was 73 percent, which is 6 percent above the mean.

Dates of Miscellaneous Phenomena

Auroras.—17–20th.

Halos, lunar.—4th, 29th.

Halos, Solar.—1st, 4th, 8–14th, 16th, 20–25th, 28–30th

Hail.—(dates and location)—7th, Dixville Notch, N.H.; 12th, Millinocket, Me.; 27th, Randolph, N.H., Barre, Gilman and Northfield, Vt. and Norfolk, Conn.

Thunderstorms.—Northern division: 6th, 7th, 12th, 14th, 24th, 27th, 30th. Southern division: 2d, 6th, 12th, 27th, 30th.

Fog, dense.—5–7th, 9–17th, 20th, 21st, 24th, 25th, 29th, 30th.

Frosts.—(latest date of killing frost during month)—Northern division: Generally on 29th and 30th. Southern division: Generally on the 28th and 29th, except on 21–23d at less susceptible places along south coast.

Sleet.—(date, division, number of stations reporting; N-northern division, S-southern division)—1st, N1; 2d, S2; 3d, S1; 4th, S1; 5th, N5, S2; 6th, N1; 7th, N1; 9th, N3; 12th, N1; 14th, N1; 16th, N21, S5; 17th, N1; 18th, N2, S1; 20th, S21; 21st, S33; 24th, N1; 26th, S1; 27th, N6; 28th, S1; 29th, N1.

Tenths of daily total radiation considered in average.

EXPLANATION OF REFERENCE MARKS

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observations. Maximum and minimum temperatures recorded at this time are nearly always correct for the date on which they are recorded. The departures from the normal temperature and precipitation are computed from the averages of the entire period through 1940 for stations having 10 or more years of record. Reference letters ^{a}, ^{b}, ^{c}, etc. appearing in the table indicate number of days missing; for example, ^{b} represents two days, etc.

† Post-office addresses of these stations are as follows: Maine — Brassua Dam, Rockwood; Hiram, West Baldwin; Ripogenus Dam, Millinocket; Winslow, Waterville: — New Hampshire — First Connecticut Lake, Pittsburg; New Durham, Alton; Pinkham Notch, Gorham; York Pond, Berlin; — Vermont — Bloomfield, North Stratford, N. H.; Cornwall, Middlebury; Mays Mill, Colrain, Mass.; Searsburg Station, Wilmington; Somerset, Wilmington; Vernon, Shelburne Falls, Mass.: — Massachusetts — Ashland, Framingham; Blue Hill, Milton; Lake Cochituate, Framingham; — Connecticut — Cream Hill, West Cornwall; Middletown, Rockfall.

†† Not included in summaries   ††† Observer for New England Power Co.   T Trace, precipitation is less than .01 inch rain or melted snow.

* Precipitation included in that of next measurement.   ** Record furnished by Massachusetts Department of Public Health; precipitation measured in morning

|| Observations taken in morning: maximum then read is charged to preceding day on which it almost always occurs.   § Also on other dates.

recorded as of preceding date.   ‡ Precipitation measured with recording gage.   ‡‡ Observation taken at 1.30 a. m., recorded as of preceding day.

[1] Regular Weather Bureau station; precipitation and temperature are for 24 hour period, midnight to midnight. [2] Precipitation measured in morning; amount recorded is for preceding 24 hours (ending on date entered). [3] Thermometers not supplied by Weather Bureau. [4] Precipitation measured in morning recorded as of preceding date. [5] Observations irregular.

Daily Precipitation for April 1947

VOL. LIX. BOSTON, MASS., MAY 1947. No. 5.

GENERAL SUMMARY

May, 1947, was the third consecutive month of subnormal temperature in New England. Cool weather with frequent showers predominated during the first three weeks of the month, with heavy to killing frosts on the 10th, 11th, 15th, and 16th. Frost damage was confined to fruit blooms in low-lying inland orchards and early gardens in the southern division. Preparative and planting operations continued to be delayed particularly in the lowlands which were too wet to be worked until near the end of the month. Elsewhere, agricultural conditions improved after the third week with the advent of sustained warmth and adequate sunshine. Light frost in many places on the 31st caused negligible damage. Total monthly precipitation was well above normal in nearly all portions of the Section except near or slightly below normal in southern New Hampshire, central Massachusetts, and eastern Connecticut. Greatest monthly totals were recorded in northern Vermont where several stations reported amounts in excess of 8 inches. Heaviest amount was recorded at Lemington, Vt., 9.34 inches. Water in storage increased seasonally, and most reservoirs were nearly full at the end of the month. Monthly maximum temperatures were recorded on the 13th and 24th, with readings generally in the 80's; monthly minima, on the 10th, 11th, 15th and 16th. Record low May temperatures were approached or equalled on the 10th and 11th, the reading of 14° at First Connecticut Lake, N. H. on the 10th and 11th being but 2° above the record May low for the Section; a reading of 20° at Falls Village, Conn. on the 10th equalled the record May low in the southern division.

E. S.

TEMPERATURE

The average monthly temperature for the Section, based on 122 records, was 53.7°, which is 1.4° below the mean for the past 60 years. The average temperature for the northern division was 51.9°; for the southern division, 55.7°. The highest monthly mean was 59.0° at Haverhill and Springfield, Mass.; the lowest was 45.5° at First Connecticut Lake, N. H. The highest recorded was 90° at Waterbury, Conn. on the 13th, and Durham, N. H. and Lowell, Mass. on the 24th; the lowest was 14° at First Connecticut Lake, N. H. on the 10th and 11th. The greatest monthly range was 68° at Nashua, N. H. and Falls Village, Conn.; the least was 35° at Block Island, R. I.

PRECIPITATION

The average monthly precipitation for the Section, based on 195 records, was 4.85 inches, which is 1.42 inches above the mean for the past 60 years. The average precipitation for the northern division was 5.46 inches; for the southern division, 4.25 inches. The greatest monthly amount reported was 9.34 inches at Lemington, Vt.; the least was 2.09 inches at Baltic, Conn. The greatest amount in 24 hours was 3.07 inches at Nantucket, Mass. on the 1st. The average number of days with .01 inch or more of precipitation was 17, which is 6 above the mean for the past 60 years.

The average snowfall for the northern division, based on 93 records, was 0.2 inch; for the southern division, based on 94 records, a trace; for the Section, based on 187 records, 0.1 inch, which is 0.2 inch below the mean for the past 60 years.

WIND, SUNSHINE, CLOUDINESS, AND HUMIDITY

The prevailing direction of the wind, based on 136 records, was southwest. The average velocity, based on the records at 14 stations, was 10.0 miles per hour, which is 0.1 mile per hour above the mean.

The sunshine, based on the records at 12 stations, averaged 48 percent of the possible amount, which is 8 percent below the mean.

Cloudiness was somewhat above the mean. The average for the Section, based on 147 records, was 9 clear, 8 partly cloudy and 14 cloudy days.

The monthly relative humidity, based on the 7:30 a. m. and 7:30 p. m. observations at 14 stations, was 75 percent, which is 1 percent below the mean.

COMPARATIVE DATA (Northern: Maine, New Hampshire, and Vermont; Southern: Massachusetts, Rhode Island, and Connecticut).

Dates of Miscellaneous Phenomena

Auroras.—14–16th, 22–24th.

Halos, lunar.—7th, 27th.

Halos, Solar.—5–7th, 11th, 12th, 16th, 17th, 19th, 22d, 25–28th.

Hail.—4th, Chelsea, Vt.; 5th, Gilman, Vt.; 24th, Fitchburg and Spot Pond, Mass.; 30th, Woodstock, Vt.

Thunderstorms.—1–7th, 18–26th, 28–30th.

Sleet.—1st, Millinocket, Me.; 4th, Salisbury, Conn.; 8th, Norfolk, Conn.

Fog, dense.—1–7th, 14th, 16–26th, 28–30th.

Frosts.—(latest date of killing frost in month)—At less susceptible places along coast of southern division, last killing frost of season was recorded in April. Elsewhere, on progressive dates, depending upon susceptibility of location, on 10th, 11th, 15th, 16th, 18th, 23d, 31st; most common dates—15th and 16th.

NOTE: Observations taken at 7:30 a. m. E S.T.

EXPLANATION OF REFERENCE MARKS

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observations. Maximum and minimum temperatures recorded at this time are nearly always correct for the date on which they are recorded. The departures from the normal temperature and precipitation are computed from the averages of the entire period through 1940 for stations having 10 or more years of record. Reference letters [a],[b],[c], etc. appearing in the table indicate number of days missing; for example, [b] represents two days, etc.

† Post-office addresses of these stations are as follows: Maine — Brassua Dam, Rockwood; Hiram, West Baldwin; Ripogenus Dam, Millinocket; Winslow, Waterville; — New Hampshire — First Connecticut Lake, Pittsburg; New Durham, Alton; Pinkham Notch, Gorham; York Pond, Berlin; — Vermont — Bloomfield, North Stratford, N. H.; Cornwall, Middlebury; Mays Mill, Colrain, Mass.; Searsburg Station, Wilmington; Somerset, Wilmington; Vernon, Shelburne Falls, Mass.; — Massachusetts — Ashland, Framingham; Blue Hill, Milton; Lake Cochituate, Framingham; — Connecticut — Cream Hill, West Cornwall; Middletown, Rockfall.

†† Not included in summaries. ††† Observer for New England Power Co. T. Trace, precipitation is less than .01 inch rain or melted snow.

* Precipitation included in that of next measurement. ** Record furnished by Massachusetts Department of Public Health; precipitation measured in morning recorded as of preceding date.

‖ Observations taken in morning; maximum then read is charged to preceding day on which it almost always occurs. § Also on other dates.

‡ Precipitation measured with recording gage. ‡‡ Observation taken at 1.30 a. m., recorded as of preceding day.

[1] Regular Weather Bureau station; precipitation and temperature are for 24 hour period, midnight to midnight. [2] Precipitation measured in morning; amount recorded is for preceding 24 hours (ending on date entered). [3] Thermometers not supplied by Weather Bureau. [4] Precipitation measured in morning recorded as of preceding date. [5] Observations irregular.

Daily Precipitation for May 1947

OL. LIX. BOSTON, MASS., JUNE 1947. No. 6.

GENERAL SUMMARY

June, 1947, was the 4th consecutive month of subnormal emperature in New England. Cool weather predominated hrough the month to the 25th, and a rather large temperature eficiency was accumulated by that date. An extended period f warmth began on the 26th and continued to the end of the onth, reducing considerably the accumulated deficiency, but ardly counterbalancing it. Subfreezing temperature and frost vere recorded on the 4th at a few susceptible places mostly in he northern division; damage was slight. Total monthly rainall and frequency of occurrence were both near normal in the outhern division, and considerably above normal in the northrn division. Greatest monthly totals were recorded in Vernont where the average for the State was more than 60 percent bove normal. The period of warmth late in the month was ttended by a general absence of rainfall, and the combination vas beneficial to agriculture. At the close of the month, however, crop development, particularly vegetables, was still backvard. Hay cutting became active after a slow start, and good ields were being reported. Potato planting in Aroostook County was completed much later than usual. For the Section a whole, the month was the coolest June since 1928. As a esult of continued heavy rainfall on the 2-3d over the waterhed of East Creek, a power dam collapsed at East Pittsford, 't., which is six miles northeast of Rutland, Vt. Outlying ections in the lower portion of Rutland were flooded to an esimated depth of 9 to 15 feet, necessitating the evacuation of 00 families and suspension of power plants. The main-line restle bridge of the Rutland Railroad over East Creek collapsed nd fell into the creek. Several old wooden bridges were detroyed. A considerable amount of meadow and cultivated round in the Rutland area was buried under a thick layer of ilt and gravel; growing crops in this area were destroyed.

E. S.

TEMPERATURE

The average monthly temperature for the Section, based on 20 records, was 62.1°, which is 1.9° below the mean for the ast 60 years. The average temperature for the northern diviion was 60.8°; for the southern division, 63.5°. The highest onthly mean was 67.2° at Haverhill, Mass.; the lowest was 4.0° at Eastport, Me. The highest recorded was 97° at 'anceboro, Me. on the 29th; the lowest was 28° at Woodstock, I. H. on the 4th. The greatest monthly range was 67° at 'anceboro, Me.; the least was 36° at Block Island, R. I.

PRECIPITATION

The average monthly precipitation for the Section, based on 92 records, was 4.50 inches, which is 0.96 inch above the ean for the past 60 years. The average precipitation for the orthern division was 5.29 inches; for the southern division, .74 inches. The greatest monthly amount reported was 9.28 ches at Rochester, Vt.; the least was 2.12 inches at Middleon, Mass. The greatest amount in 24 hours was 4.12 inches t East Barnet, Vt. on the 2-3d. The average number of days with .01 inch or more of precipitation was 12, which is 1 above the mean for the past 60 years.

WIND, SUNSHINE, CLOUDINESS, AND HUMIDITY

The prevailing direction of the wind, based on 136 records, was southwest. The average velocity, based on the records at 14 stations, was 8.8 miles per hour, which is 0.1 mile per hour below the mean.

The sunshine, based on the records at 11 stations, averaged 58 percent of the possible amount, which is 1 percent below the mean.

Cloudiness was slightly above the mean. The average for the Section, based on 145 records, was 11 clear, 8 partly cloudy and 11 cloudy days.

The monthly relative humidity, based on the 7:30 a. m. and 7:30 p. m. observations at 13 stations, was 78 percent, which is 3 percent above the mean.

COMPARATIVE DATA (Northern: Maine, New Hampshire, and Vermont; Southern: Massachusetts, Rhode Island, and Connecticut).

Dates of Miscellaneous Phenomena

Auroras.—1st, 11–14th, 16–18th.

Halos, lunar.—2d, 4th, 28th.

Halos, Solar.—1st, 2d, 4–6th, 12–14th, 23d, 26th.

Hail.—(state, date, number of stations reporting)—Maine: None. New Hampshire: 6th, 3; 18th, 1; 21st, 1. Vermont: 6th, 1; 20th, 1; 21st, 1; 30th, 1. Massachusetts: 18th, 1; 19th, 4. Rhode Island: None. Connecticut: 6th, 1; 19th, 1; 25th, 1.

Thunderstorms.—1–3d, 6–8th, 11–15th, 17–28th, 30th.

Fog, dense.—2–12th, 14–30th.

Sleet.—None.

Frosts, killing.—On 4th, at some of the more susceptible places in the northern division, and at Norfolk (in valley), Conn.; on 5th, at Vanceboro, Me. and Woodstock, N. H.

NOTE: Observations taken at 7:30 a. m. E.S.T.

EXPLANATION OF REFERENCE MARKS

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observations. Maximum and minimum temperatures recorded at this time are nearly always correct for the date on which they are recorded. The departures from the normal temperature and precipitation are computed from the averages of the entire period through 1940 for stations having 10 or more years of record. Reference letters ^{a}, ^{b}, ^{c}, etc. appearing in the table indicate number of days missing; for example, ^{b} represents two days, etc.

† Post-office addresses of these stations are as follows: Maine — Brassua Dam, Rockwood; Hiram, West Baldwin; Ripogenus Dam, Millinocket; Winslow, Waterville; — New Hampshire — First Connecticut Lake, Pittsburg; New Durham, Alton; Pinkham Notch, Gorham; York Pond, Berlin; — Vermont — Bloomfield, North Stratford, N. H.; Cornwall, Middlebury; Mays Mill, Colrain, Mass.; Searsburg Station, Wilmington; Somerset, Wilmington; Vernon, Shelburne Falls, Mass.; — Massachusetts — Ashland, Framingham; Blue Hill, Milton; Lake Cochituate, Framingham; — Connecticut — Cream Hill, West Cornwall; Middletown, Rockfall.

†† Not included in summaries. ††† Observer for New England Power Co. T. Trace, precipitation is less than .01 inch rain or melted snow.

* Precipitation included in that of next measurement. ** Record furnished by Massachusetts Department of Public Health: precipitation measured in morning.

‖ Observations taken in morning; maximum then read is charged to preceding day on which it almost always occurs. § Also on other dates. recorded as of preceding date. ‡ Precipitation measured with recording gage. ‡‡ Observation taken at 1.30 a. m., recorded as of preceding day.

[1] Regular Weather Bureau station; precipitation and temperature are for 24 hour period, midnight to midnight. [2] Precipitation measured in morning; amount recorded is for preceding 24 hours (ending on date entered). [3] Thermometers not supplied by Weather Bureau. [4] Precipitation measured in morning recorded as of preceding date. [5] Observations irregular.

VOL. LIX. BOSTON, MASS., JULY 1947. No. 7.

GENERAL SUMMARY

July, 1947, in New England was the first month of above normal temperature since February, 1947. It was warmer than normal in all parts of the Section, and markedly so over a large portion of the northern division where it was the warmest July since 1921. Except for a few short periods, daily mean temperatures were persistently above normal, and gardens and crops responded with a rapid growth through the month. While extremes of high temperature were lacking during the month, the relatively high daily level of temperature and an unusually high percentage of humidity created several sustained periods of oppressive conditions. Rainfall was decidedly above normal in the northern division; in the southern division rainfall averaged slightly above normal, but with several sizeable areas of subnormal precipitation. A number of noteworthy electrical storms occurred during the month, the most serious and widespread of which took place over Aroostook County, Me. during the afternoon of the 31st. Most of the estimated quarter million damage was caused by hail in the potato fields, while lesser damage to crops and buildings was caused by high winds. Severe local storms (electrical and heavy rain) occurred at North Adams, Mass. on the 15th, and in the Greater Boston area on the 28th. A tornado was observed in a sparsely settled section of Amherst, Mass. on the 16th. Length of path was about a quarter mile, and no damage was reported. E. S.

TEMPERATURE

The average monthly temperature for the Section, based on 119 records, was 71.2°, which is 2.1° above the mean for the past 60 years. The average temperature for the northern division was 70.3°; for the southern division, 72.1°. The highest monthly mean was 76.6° at Haverhill, Mass.; the lowest was 61.5° at Eastport, Me. The highest recorded was 95° at Haverhill, Mass. on the 30th; the lowest was 38° at Somerset, Vt. on the 3d and 4th. The greatest monthly range was 53° at Woodstock, N. H.; the least was 25° at Block Island, R. I.

PRECIPITATION

The average monthly precipitation for the Section, based on 191 records, was 4.84 inches, which is 1.06 inches above the mean for the past 60 years. The average precipitation for the northern division was 5.29 inches; for the southern division, 4.40 inches. The greatest monthly amount reported was 9.14 inches at Bloomfield, Vt.; the least was 2.14 inches at Lakeport, N. H. The greatest amount in 24 hours was 4.20 inches at Lincoln, N. H. on the 22-23d. The average number of days with .01 inch or more of precipitation was 13, which is 2 above the mean for the past 60 years.

WIND, SUNSHINE, CLOUDINESS, AND HUMIDITY

AUG 22 1947

The prevailing direction of the wind, based on 135 records, was southwest. The average velocity, based on the records at 14 stations, was 8.1 miles per hour, which is 0.1 mile per hour below the mean.

The sunshine, based on the records at 12 stations, averaged 55 percent of the possible amount, which is 6 percent below the mean.

Cloudiness was somewhat above the mean. The average for the Section, based on 136 records, was 9 clear, 12 partly cloudy and 10 cloudy days.

The monthly relative humidity, based on the 7:30 a. m. and 7:30 p. m. observations at 14 stations, was 83 percent, which is 5 percent above the mean.

COMPARATIVE DATA (Northern: Maine, New Hampshire, and Vermont; Southern: Massachusetts, Rhode Island, and Connecticut).

NOTE: Observations taken at 7:30 a. m. E S.T.

EXPLANATION OF REFERENCE MARKS

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observations. Maximum and minimum temperatures recorded at this time are nearly always correct for the date on which they are recorded. The departures from the normal temperature and precipitation are computed from the averages of the entire period through 1940 for stations having 10 or more years of record. Reference letters ^{a},^{b},^{c}, etc. appearing in the table indicate number of days missing; for example, ^{b} represents two days, etc.

† Post-office addresses of these stations are as follows: Maine — Brassua Dam, Rockwood; Hiram, West Baldwin; Ripogenus Dam, Millinocket; Winslow, Waterville; — New Hampshire — First Connecticut Lake, Pittsburg; New Durham, Alton; Pinkham Notch, Gorham; York Pond, Berlin; — Vermont — Bloomfield, North Stratford, N. H.; Cornwall, Middlebury; Mays Mill, Colrain, Mass.; Searsburg Station, Wilmington; Somerset, Wilmington; Vernon, Shelburne Falls, Mass.; — Massachusetts — Ashland, Framingham; Blue Hill, Milton; Lake Cochituate, Framingham; — Connecticut — Cream Hill, West Cornwall; Middletown, Rockfall.

†† Not included in summaries ††† Observer for New England Power Co. T. Trace, precipitation is less than .01 inch rain or melted snow.

* Precipitation included in that of next measurement. ** Record furnished by Massachusetts Department of Public Health; precipitation measured in morning recorded as of preceding date.

‖ Observations taken in morning; maximum then read is charged to preceding day on which it almost always occurs. § Also on other dates.

‡ Precipitation measured with recording gage. ‡‡ Observation taken at 1.30 a. m., recorded as of preceding day.

[1] Regular Weather Bureau station; precipitation and temperature are for 24 hour period, midnight to midnight. [2] Precipitation measured in morning; amount recorded is for preceding 24 hours (ending on date entered). [3] Thermometers not supplied by Weather Bureau. [4] Precipitation measured in morning recorded as of preceding date.

[5] Observations irregular.

Daily Precipitation for July 1947

VOL. LIX. BOSTON, MASS., AUGUST 1947. NO. 8.

GENERAL SUMMARY

New England's weather during August, 1947, was beneficial to agriculture, and was especially favorable for all out-door activities. Resort and vacation interests in particular were favored. Early harvests of nearly all crops were showing good yields, although the hay crop was of rather poor quality, probably due to insufficient rainfall. For the same reason, fields and pastures were beginning to brown. The month opened with a cool spell for the first two days, following which, warm weather predominated for the remainder of the month. In Boston, the temperature reached 90° or higher on 9 days. Rainfall was generally below normal throughout the Section, particularly over coastal Maine and southeastern Massachusetts, and there was an average of 7 days with measurable rainfall against a normal of 10. Following is a brief summary of the more noteworthy damaging storms which occurred during the month: Southern Hampden County, late afternoon of the 8th; local flash floods blocked roads and stalled traffic. Northern portions of Maine and Vermont and northeastern Massachusetts, afternoon and evening of 15th; heavy rains and lightning (and high winds northeastern Mass.); damage in excess of $50,000. In early afternoon of 26th, Worcester and Middlesex Counties, Mass.; torrential rain, lightning and high wind; estimated damage, $12,000. It may be recalled that the weather of August, 1946, differed decidedly from that of this August, in that August, 1946, was nearly 6° cooler, its average rainfall, 6.30 inches, was exactly three times greater and its frequency of precipitation, 14 days, was just double that of this August.

TEMPERATURE

The average monthly temperature for the Section, based on 119 records, was 70.3°, which is 3.2° above the mean for the past 60 years. The average temperature for the northern division was 69.1°; for the southern division, 71.5°. The highest monthly mean was 74.4° at Haverhill and Springfield, Mass.; the lowest was 63.1° at Eastport, Me. The highest recorded was 99° at six stations on the 13th, 15th or 24th; the lowest was 32° at Presque Isle, Me. on the 30th. The greatest monthly range was 65° at Vanceboro, Me.; the least was 23° at Block Island, R. I.

PRECIPITATION

The average monthly precipitation for the Section, based on 194 records, was 2.10 inches, which is 1.65 inches below the mean for the past 60 years. The average precipitation for the northern division was 1.82 inches; for the southern division, 2.36 inches. The greatest monthly amount reported was 7.46 inches at Westbrook, Conn.; the least was 0.26 inch at Rockland, Me. The greatest amount in 24 hours was 3.51 inches at Danbury, Conn. on the 16-17th. The average number of days with .01 inch or more of precipitation was 7, which is 3 below the mean for the past 60 years.

WIND, SUNSHINE, CLOUDINESS, AND HUMIDITY

The prevailing direction of the wind, based on 132 records, was southwest. The average velocity, based on the records at 14 stations, was 7.4 miles per hour, which is 0.4 mile per hour below the mean.

The sunshine, based on the records at 12 stations, averaged 63 percent of the possible amount, which is 3 percent above the mean.

Cloudiness was somewhat below the mean. The average for the Section, based on 134 records, was 15 clear, 9 partly cloudy and 7 cloudy days.

The monthly relative humidity, based on the 7:30 a. m. and 7:30 p. m. observations at 14 stations, was 83 percent, which is 2 percent above the mean.

COMPARATIVE DATA (Northern: Maine, New Hampshire, and Vermont; Southern: Massachusetts, Rhode Island, and Connecticut).

Dates of Miscellaneous Phenomena

Auroras.—11th, 12th, 15–20th, 22d, 23d.

Halos, lunar.— None.

Halos, Solar.—21st, 25th.

Hail.—22d, Cavendish, Vt.; 24th, Greenville, Me.; 25th, Corinna, Me.; 26th, Clinton, Mass.; 31st, Woodland, Me.

Thunderstorms.—1st, 4th, 6–10th, 12–17th, 19th, 20th, 24–31st.

Fog, dense.—2–31st.

Frosts.—(or earliest date of minimum temperature 32° or lower)—On 30th, vicinity of Presque Isle, Me.

NOTE: Observations taken at 7:30 a. m. E.S.T.

EXPLANATION OF REFERENCE MARKS

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observations. Maximum and minimum temperatures recorded at this time are nearly always correct for the date on which they are recorded. The departures from the normal temperature and precipitation are computed from the averages of the entire period through 1940 for stations having 10 or more years of record. Reference letters [a], [b], [c], etc. appearing in the table indicate number of days missing; for example, [b] represents two days, etc.

† Post-office addresses of these stations are as follows: Maine — Brassua Dam, Rockwood; Hiram, West Baldwin; Ripogenus Dam, Millinocket; Winslow, Waterville; — New Hampshire — First Connecticut Lake, Pittsburg; New Durham, Alton; Pinkham Notch, Gorham; York Pond, Berlin; — Vermont — Bloomfield, North Stratford, N. H.; Cornwall, Middlebury; Mays Mill, Colrain, Mass.; Searsburg Station, Wilmington; Somerset, Wilmington; Vernon, Shelburne Falls, Mass.; — Massachusetts — Ashland, Framingham; Blue Hill, Milton; Lake Cochituate, Framingham; — Connecticut — Cream Hill, West Cornwall; Middletown, Rockfall.

†† Not included in summaries. ††† Observer for New England Power Co. T. Trace, precipitation is less than .01 inch rain or melted snow.

* Precipitation included in that of next measurement. ** Record furnished by Massachusetts Department of Public Health: precipitation measured in morning recorded as of preceding date.

‖ Observations taken in morning; maximum then read is charged to preceding day on which it almost always occurs. § Also on other dates.

‡ Precipitation measured with recording gage. ‡‡ Observation taken at 1.30 a. m., recorded as of preceding day.

[1] Regular Weather Bureau station; precipitation and temperature are for 24 hour period, midnight to midnight. [2] Precipitation measured in morning; amount recorded is for preceding 24 hours (ending on date entered). [3] Thermometers not supplied by Weather Bureau. [4] Precipitation measured in morning recorded as of preceding date. [5] Observations irregular.

VOL. LIX. BOSTON, MASS., SEPTEMBER 1947. NO. 9.

GENERAL SUMMARY

The temperature record of September, 1947, in New England is an excellent example of the persistence of temperature trends for periods of varying duration. The first 18 days of the month were a period of excessive warmth, with daily temperature persistently above normal generally over the Section. At the end of that period, the daily average temperature excess was more than 7°. A sudden and sharp change to colder weather set in on the 20th, and thereafter to the end of the month temperatures were just as persistently subnormal, to the extent that the month for the Section as a whole averaged only slightly warmer than normal. It was, also, the third consecutive month of above normal temperature. A new record September low temperature for the northern division was established at Dorset, Vt. on the 27th (15°); and for the southern division, at Falls Village, Conn. on the 28th (17°). While rainfall was less than normal generally throughout the Section, both as to amount and frequency, somewhat greater monthly totals were recorded in the southern division. The first traces of snow of the season were recorded at a few extreme northern stations on the 23d, and at some interior northern stations in the closing days of the month. Violent thunderstorms and high winds caused very heavy and widespread damage on the 2d over eastern New England from southern Maine and New Hampshire southward. Total damage was estimated at 20 million dollars. There were several reports received of local storms of tornadic characteristics in the vicinity of Danielson, Conn. and Brockton and South Easton, Mass. In the latter town, a man was killed when the roof of a garage collapsed. Another violent local storm occurred shortly before 3 p.m. (E.S.T.) of the 15th at Stratford, Conn. A workman was killed when a sudden violent gust of wind ripped off a large section of a roof of a partially completed building. E. S.

TEMPERATURE

The average monthly temperature for the Section, based on 120 records, was 60.9°, which is 0.6° above the mean for the past 60 years. The average temperature for the northern division was 59.1°; for the southern division, 62.8°. The highest monthly mean was 66.0° at New London, Conn.; the lowest was 53.7° at Caribou, Me. The highest recorded was 93° at Woodland, Me. on the 7th and Washington, Conn. on the 13th; the lowest was 15° at Dorset, Vt. on the 27th. The greatest monthly range was 74° at Falls Village, Conn.; the least was 38° at Block Island, R. I.

PRECIPITATION

The average monthly precipitation for the Section, based on 193 records, was 2.77 inches, which is 1.00 inch below the mean for the past 60 years. The average precipitation for the northern division was 2.23 inches; for the southern division, 3.28 inches. The greatest monthly amount reported was 7.01 inches at Mansfield, Mass.; the least was 0.78 inch at Hanover, N. H. The greatest amount in 24 hours was 4.36 inches at Mansfield, Mass. on the 2d. The average number of days with .01 inch or more of precipitation was 7, which is 2 below the mean for the past 60 years.

The average snowfall for the northern division, based on 95 records, was a trace; for the southern division, based on 99 records, a trace; for the Section, based on 194 records, a trace, which is the mean for the past 60 years.

WIND, SUNSHINE, CLOUDINESS, AND HUMIDITY

The prevailing direction of the wind, based on 133 records, was southwest. The average velocity, based on the records at 14 stations, was 8.2 miles per hour, which is 0.5 mile per hour below the mean.

The sunshine, based on the records at 12 stations, averaged 59 percent of the possible amount, which is 2 percent above the mean.

Cloudiness was slightly below the mean. The average for the Section, based on 138 records, was 14 clear, 8 partly cloudy and 8 cloudy days.

The monthly relative humidity, based on the 7:30 a. m. and 7:30 p. m. observations at 14 stations, was 81 percent, which is the mean.

COMPARATIVE DATA (Northern: Maine, New Hampshire, and Vermont; Southern: Massachusetts, Rhode Island, and Connecticut).

NOTE: Observations taken at 7:30 a. m. E. S. T.

EXPLANATION OF REFERENCE MARKS

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observations. Maximum and minimum temperatures recorded at this time are nearly always correct for the date on which they are recorded. The departures from the normal temperature and precipitation are computed from the averages of the entire period through 1940 for stations having 10 or more years of record. Reference letters [a], [b], [c], etc. appearing in the table indicate number of days missing; for example, [b] represents two days, etc.

† Post-office addresses of these stations are as follows: Maine — Brassua Dam, Rockwood; Hiram, West Baldwin; Ripogenus Dam, Millinocket; Winslow, Waterville; — New Hampshire — First Connecticut Lake, Pittsburg; New Durham, Alton; Pinkham Notch, Gorham; York Pond, Berlin; — Vermont — Bloomfield, North Stratford, N. H.; Cornwall, Middlebury; Mays Mill, Colrain, Mass.; Searsburg Station, Wilmington; Somerset, Wilmington; Vernon, Shelburne Falls, Mass.; — Massachusetts — Ashland, Framingham; Blue Hill, Milton; Lake Cochituate, Framingham; — Connecticut — Cream Hill, West Cornwall; Middletown, Rockfall.

†† Not included in summaries. ††† Observer for New England Power Co. T. Trace, precipitation is less than .01 inch rain or melted snow.

* Precipitation included in that of next measurement. ** Record furnished by Massachusetts Department of Public Health; precipitation measured in morning recorded as of preceding date.

‖ Observations taken in morning; maximum then read is charged to preceding day on which it almost always occurs. § Also on other dates.

‡ Precipitation measured with recording gage. ‡‡ Observation taken at 1.30 a. m., recorded as of preceding day.

[1] Regular Weather Bureau station; precipitation and temperature are for 24 hour period, midnight to midnight. [2] Precipitation measured in morning; amount recorded is for preceding 24 hours (ending on date entered). [3] Thermometers not supplied by Weather Bureau. [4] Precipitation measured in morning recorded as of preceding date. [5] Observations irregular.

Daily Precipitation for September 1947

VOL. LIX. BOSTON, MASS., OCTOBER 1947. No. 10.

GENERAL SUMMARY

The drought of October, 1947, in New England will be remembered for its intensity and duration, particularly in southern portions of Maine and New Hampshire and eastern portions of the southern division. The preceding two months had been rather dry throughout the section, and, at the end of September, ground water was definitely deficient and there was general need of rain. In addition, the month was the warmest October of record; sunshine, too, was recorded in the greatest abundance for October; and the average cloudiness for the Section was the lowest ever recorded in that month. Thus, there were present the factors of greatest consequence in the intensification of the drought which approached a near-explosive state in the woodlands of the aforementioned areas during the third decade of the month prior to the 29th. Several small villages adjoining wooded areas were completely destroyed by fire. In the burning of Bar Harbor, Me., several lives were lost, and property losses were estimated at more than 3 million. Damage or loss to agriculture was less tangible, and was limited to loss of pasturage, delayed fall plowing, and to the necessity of hauling water for home and livestock at many farms. Moderate to heavy rain from the 29th to the 31st over nearly all of the Section except Maine brought temporary alleviation of the drought. In the critical areas of Maine, light rainfall during that period aided in checking the fires, but conditions there still presented a definite fire threat at the end of the month. New high temperature records for so late in the season were established at Boston and many other points on the 17th and 27th.

E. S.

TEMPERATURE

The average monthly temperature for the Section, based on 117 records, was 55.6°, which is 6.0° above the mean for the past 60 years. The average temperature for the northern division was 53.7°; for the southern division, 57.7°. The highest monthly mean was 61.6° at Boston, Mass.; the lowest was 48.6° at First Connecticut Lake, N.H. The highest recorded was 91° at Nashua, N.H. and West Lebanon, N.H. on the 17th; the lowest was 13° at Cavendish, Vt. and Chelsea, Vt. on the 25th. The greatest monthly range was 74° at Nashua, N.H. and Chelsea, Vt.; the least was 34° at Block Island, R. I.

PRECIPITATION

The average monthly precipitation for the Section, based on 197 records, was 1.36 inches, which is 2.10 inches below the mean for the past 60 years. The average precipitation for the northern division was 0.74 inch; for the southern division, 1.95 inches. The greatest monthly amount reported was 4.90 inches at Slocum, R.I.; the least was 0.04 inch at Rumford, Me. The greatest amount in 24 hours was 3.49 inches at Slocum, R.I. on the 30-31st. The average number of days with .01 inch or more of precipitation was 4, which is 5 below the mean for the past 60 years.

The average snowfall for the northern division, based on 97 records, was a trace; for the southern division, based on 100 records, a trace; for the Section, based on 197 records, a trace, which is 0.2 inch below the mean for the past 60 years.

WIND, SUNSHINE, CLOUDINESS, AND HUMIDITY

The prevailing direction of the wind, based on 134 records, was southwest. The average velocity, based on the records at 14 stations, was 8.3 miles per hour, which is 1.7 miles per hour below the mean.

The sunshine, based on the records at 12 stations, averaged 72 percent of the possible amount, which is 18 percent above the mean.

Cloudiness was decidedly below the mean. The average for the Section, based on 137 records, was 20 clear, 6 partly cloudy and 5 cloudy days.

The monthly relative humidity, based on the 7:30 a. m. and 7:30 p. m. observations at 14 stations, was 79 percent, which is the mean.

COMPARATIVE DATA (Northern: Maine, New Hampshire, and Vermont; Southern: Massachusetts, Rhode Island, and Connecticut).

NOTE: Observations taken at 7:30 a. m. E. S. T.

EXPLANATION OF REFERENCE MARKS

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observations. Maximum and minimum temperatures recorded at this time are nearly always correct for the date on which they are recorded. The departures from the normal temperature and precipitation are computed from the averages of the entire period through 1940 for stations having 10 or more years of record. Reference letters [a], [b], [c], etc. appearing in the table indicate number of days missing; for example, [b] represents two days, etc.

† Post-office addresses of these stations are as follows: Maine – Brassua Dam, Rockwood; Hiram, West Baldwin; Ripogenus Dam, Millinocket; Winslow, Waterville; — New Hampshire – First Connecticut Lake, Pittsburg; New Durham, Alton; Pinkham Notch, Gorham; York Pond, Berlin; — Vermont – Bloomfield, North Stratford, N. H; Cornwall, Middlebury; Mays Mill, Colrain, Mass.; Searsburg Station, Wilmington; Somerset, Wilmington; Vernon, Shelburne Falls, Mass.; — Massachusetts – Ashland, Framingham; Blue Hill, Milton; Lake Cochituate, Framingham; — Connecticut – Cream Hill, West Cornwall; Middletown, Rockfall.

†† Not included in summaries. ††† Observer for New England Power Co. T. Trace, precipitation is less than .01 inch rain or melted snow.

* Precipitation included in that of next measurement. ** Record furnished by Massachusetts Department of Public Health; precipitation measured in morning

‖ Observations taken in morning; maximum then read is charged to preceding day on which it almost always occurs. § Also on other dates. recorded as of preceding date. ‡ Precipitation measured with recording gage. ‡‡ Observation taken at 1.30 a. m., recorded as of preceding day.

[1] Regular Weather Bureau station; precipitation and temperature are for 24 hour period, midnight to midnight. [2] Precipitation measured in morning; amount recorded is for preceding 24 hours (ending on date entered). [3] Thermometers not supplied by Weather Bureau. [4] Precipitation measured in morning recorded as of preceding date. [5] Observations irregular.

VOL. LIX. BOSTON, MASS., NOVEMBER 1947. No. 11.

GENERAL SUMMARY

The storm of the 11-12th was the outstanding weather event of November, 1947, in New England. The storm developed off the Delaware coast on the evening of the 11th and moved northeastward with moderate velocity, passing just west and north of Nantucket, Mass. during the afternoon of the 12th. Winds attending the storm reached gale force over eastern and southern portions of the southern division, and there were reliable reports of gusts of hurricane force in Rhode Island and the Counties of Dukes, Nantucket and Barnstable in Massachusetts. Maximum rainfall intensities were recorded in these and areas adjoining to the north and west. Total storm loss, including damage from high tides, was estimated at a million dollars. Another notable coastal storm occurred on the 8th, with maximum storm effect in the Narragansett Bay area of Rhode Island and Nantucket County, Mass. Southeast gales occurring at the time of high tide caused heavy damage to small craft of all types and to water-front property. On the western end of Nantucket Island, a residence and six bath houses were swept into the sea by the heavy surf and high tide. The month was one of rather steady cold after the 8th, with only a brief interval of above-normal warmth from about the 23d to the 25th. The total monthly volume of snow was close to normal, and at the end of the month, a snow cover existed over interior portions of the northern division, ranging up to 18 inches in depth over northwestern Maine. E.S.

TEMPERATURE

The average monthly temperature for the Section, based on 123 records, was 36.0°, which is 2.1° below the mean for the past 60 years. The average temperature for the northern division was 33.5°; for the southern division, 38.7°. The highest monthly mean was 44.2° at Block Island R.I.; the lowest was 27.8° at First Connecticut Lake, N.H. The highest recorded was 68° at Rumford, Me. and Rutland, Vt. on the 3d; the lowest was −6° at Greenville, Me. on the 30th. The greatest monthly range was 68° at Chelsea, Vt.; the least was 34° at Eastport, Me., Chestnut Hill, Mass. and Block Island, R. I.

PRECIPITATION

The average monthly precipitation for the Section, based on 197 records, was 5.12 inches, which is 1.56 inches above the mean for the past 60 years. The average precipitation for the northern division was 4.66 inches; for the southern division, 5.57 inches. The greatest monthly amount reported was 8.78 inches at Washington, Conn.; the least was 2.19 inches at Bethlehem, N.H. The greatest amount in 24 hours was 5.38 inches at Spot Pond, Mass. on the 11-12th. The average number of days with .01 inch or more of precipitation was 8, which is 2 below the mean for the past 60 years.

The average snowfall for the northern division, based on 92 records, was 8.4 inches; for the southern division, based on 94 records, 1.2 inches; for the Section, based on 186 records, 4.7 inches, which is 0.1 inch below the mean for the past 60 years.

WIND, SUNSHINE, CLOUDINESS, AND HUMIDITY

The prevailing direction of the wind, based on 139 records, was northwest. The average velocity, based on the records at 14 stations, was 10.2 miles per hour, which is 0.6 mile per hour below the mean.

The sunshine, based on the records at 12 stations, averaged 46 percent of the possible amount, which is 2 percent above the mean.

Cloudiness was slightly above the mean. The average for the Section, based on 147 records, was 9 clear, 7 partly cloudy and 14 cloudy days.

The monthly relative humidity, based on the 7:30 a. m. and 7:30 p. m. observations at 14 stations, was 78 percent, which is 2 percent above the mean.

COMPARATIVE DATA (Northern: Maine, New Hampshire, and Vermont; Southern: Massachusetts, Rhode Island, and Connecticut).

Dates of Miscellaneous Phenomena

Auroras.—9–11th, 18th, 19th.

Halos, lunar.—4th, 5th, 28th, 30th.

Halos. Solar.—3–5th, 11th, 15th, 20th 22d.

Hail.—12th, New Haven, Norwalk and Washington, Conn.; 28th, Kingston, R. I.

Thunderstorms.—24th, Westerly, R. I., New Haven, New London and Westbrook, Conn.; 28th, Kingston and Middletown, R. I.

Fog, dense.—1–4th, 7th, 10th, 12th, 23d, 24th, 28–30th.

Frosts.—Killing frost penetrated to sheltered places along immediate coast and to islands just off the coast on 15th or 27th. (Killing frosts recorded elsewhere in Section earlier in season.)

Sleet.—(date, division, number of stations reporting: N–northern division, S–southern division)—8th, N1; 11th, N7, S1; 12th, N2, S7; 15th, S1; 16th, N3, S4; 17th, N1; 18th, N2; 22d, N5; 23d, N4; 24th, N7, S15; 25th, N2, S2; 28th, N2, S2; 29th, S1.

Tenths of daily **total radiation** considered in average.

EXPLANATION OF REFERENCE MARKS

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observations. Maximum and minimum temperatures recorded at this time are nearly always correct for the date on which they are recorded The departures from the normal temperature and precipitation are computed from the averages of the entire period through 1940 for stations having 10 or more years of record Reference letters [a], [b], [c], etc. appearing in the table indicate number of days missing; for example, [b] represents two days, etc.

† Post-office addresses of these stations are as follows: Maine – Brassua Dam, Rockwood; Hiram, West Baldwin; Ripogenus Dam, Millinocket; Winslow, Waterville; — New Hampshire — First Connecticut Lake, Pittsburg; New Durham, Alton; Pinkham Notch, Gorham; York Pond, Berlin; — Vermont – Bloomfield, North Stratford, N. H; Cornwall, Middlebury; Mays Mill, Colrain, Mass.; Searsburg Station, Wilmington; Somerset, Wilmington; Vernon, Shelburne Falls, Mass.; — Massachusetts – Ashland, Framingham; Blue Hill, Milton; Lake Cochituate, Framingham; — Connecticut – Cream Hill, West Cornwall; Middletown, Rockfall.

†† Not included in summaries ††† Observer for New England Power Co. T. Trace, precipitation is less than .01 inch rain or melted snow.

* Precipitation included in that of next measurement. ** Record furnished by Massachusetts Department of Public Health: precipitation measured in morning

‖ Observations taken in morning: maximum then read is charged to preceding day on which it almost always occurs. § Also on other dates.

recorded as of preceding date. ‡ Precipitation measured with recording gage. ‡‡ Observation taken at 1.30 a. m., recorded as of preceding day.

[1] Regular Weather Bureau station: precipitation and temperature are for 24 hour period, midnight to midnight. [2] Precipitation measured in morning; amount recorded is for preceding 24 hours (ending on date entered). [3] Thermometers not supplied by Weather Bureau. [4] Precipitation measured in morning recorded as of preceding date. [5] Observations irregular.

Daily Precipitation for November 1947

VOL. LIX. BOSTON, MASS., DECEMBER 1947. NO. 12.

GENERAL SUMMARY

December, 1947, in New England was a month of unusual severity with regard to both persistence of cold weather throughout the Section, and heavy snow in the southern division. In Boston, total snowfall (26.8 inches) was greater than that recorded in any other December of record, while the volume of snow for the month in the southern division was nearly 3 times the normal, and was exceeded in only two Decembers: 1902 and 1945. Two coastal storms accounted in large measure for the great amount of snow: those of the 23d-24th and the 26-27th. In southeastern Massachusetts, particularly Cape Cod, snowfall was, as usual, considerably less than elsewhere, since much of the precipitation there occurred as rain. Snowfall in the northern division as a whole averaged slightly greater than normal, but was much below normal in extreme northern portions. Persistence of subfreezing after the 23d prevented any general appreciable melting, and the relatively small reduction of the snow cover resulted, principally, from settling and evaporation. At the end of the month, a snow cover of widely varying but unusually high average depth blanketed the entire Section except parts of Cape Cod. Maximum depth, in excess of 30 inches, was concentrated over northeastern Massachusetts away from the immediate coast. Although there were no occurrences of unusually low minimum temperatures, there was a persistence of cold with only a few brief mild periods. Thus, the general feeling that this early winter month was one of prolonged and unusual severity is substantially corroborated by statistical analysis.

E. S.

TEMPERATURE

The average monthly temperature for the Section, based on 123 records, was 23.1°, which is 3.2° below the mean for the past 60 years. The average temperature for the northern division was 19.1°; for the southern division, 27.6°. The highest monthly mean was 34.3° at Block Island, R.I.; the lowest was 10.8° at First Connecticut Lake, N.H. The highest recorded was 64° at Greenville, R. I. on the 3d; the lowest was −20° at Wilder, Vt. on the 25th and 26th. The greatest monthly range was 68° at Concord, Mass.; the least was 37° at Nantucket, Mass.

PRECIPITATION

The average monthly precipitation for the Section, based on 191 records, was 2.56 inches, which is 0.77 inch below the mean for the past 60 years. The average precipitation for the northern division was 1.93 inches; for the southern division, 3.17 inches. The greatest monthly amount reported was 5.30 inches at Blue Hill, Mass.; the least was 0.55 inch at Bethlehem, N.H. The greatest amount in 24 hours was 2.21 inches at Greenwich, Conn., on the 26-27th. The average number of days with .01 inch or more of precipitation was 10, which is the mean for the past 60 years.

The average snowfall for the northern division, based on 90 records, was 19.6 inches; for the southern division, based on 90 records, 23.2 inches; for the Section, based on 180 records, 21.4 inches, which is 10.0 inches above the mean for the past 60 years.

WIND, SUNSHINE, CLOUDINESS, AND HUMIDITY

The prevailing direction of the wind, based on 139 records, was northwest. The average velocity, based on the records at 14 stations, was 10.8 miles per hour, which is 0.1 mile per hour below the mean.

The sunshine, based on the records at 11 stations, averaged 58 percent of the possible amount, which is 14 percent above the mean.

Cloudiness was slightly below the mean. The average for the Section, based on 147 records, was 12 clear, 8 partly cloudy and 11 cloudy days.

The monthly relative humidity, based on the 7:30 a. m. and 7:30 p. m. observations at 13 stations, was 74 percent, which is 3 percent below the mean.

COMPARATIVE DATA (Northern: Maine, New Hampshire, and Vermont; Southern: Massachusetts, Rhode Island, and Connecticut).

Tenths of daily total radiation considered in average.

EXPLANATION OF REFERENCE MARKS

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observations. Maximum and minimum temperatures recorded at this time are nearly always correct for the date on which they are recorded. The departures from the normal temperature and precipitation are computed from the averages of the entire period through 1940 for stations having 10 or more years of record. Reference letters ^{a}, ^{b}, ^{c}, etc. appearing in the table indicate number of days missing: for example, ^{b} represents two days, etc.

† Post-office addresses of these stations are as follows: Maine – Brassua Dam, Rockwood; Hiram, West Baldwin; Ripogenus Dam, Millinocket; Winslow, Waterville; — New Hampshire – First Connecticut Lake, Pittsburg; New Durham, Alton; Pinkham Notch, Gorham; York Pond, Berlin; – Vermont – Bloomfield, North Stratford, N. H; Cornwall, Middlebury; Mays Mill, Colrain, Mass.; Searsburg Station, Wilmington; Somerset, Wilmington; Vernon, Shelburne Falls, Mass.; – Massachusetts – Ashland, Framingham; Blue Hill, Milton; Lake Cochituate, Framingham; — Connecticut – Cream Hill, West Cornwall; Middletown, Rockfall.

†† Not included in summaries. ††† Observer for New England Power Co. T. Trace, precipitation is less than .01 inch rain or melted snow.

* Precipitation included in that of next measurement. ** Record furnished by Massachusetts Department of Public Health: precipitation measured in morning

‖ Observations taken in morning; maximum then read is charged to preceding day on which it almost always occurs. § Also on other dates recorded as of preceding date. ‡ Precipitation measured with recording gage. ‡‡ Observation taken at 1.30 a. m., recorded as of preceding day.

[1] Regular Weather Bureau station; precipitation and temperature are for 24 hour period, midnight to midnight. [2] Precipitation measured in morning; amount recorded is for preceding 24 hours (ending on date entered). [3] Thermometers not supplied by Weather Bureau. [4] Precipitation measured in morning recorded as of preceding date. [5] Observations irregular.

Daily Precipitation for December 1947

VOL. LIX. BOSTON, MASS., ANNUAL, 1947. NO. 13.

GENERAL SUMMARY.

The excess in temperature that had characterized the last four months of 1946 was continued through the first four months of 1947, making the winter one of outstanding, though not record-breaking mildness. Precipitation amounts in January and February were near normal, but in January a greater than usual proportion was in the form of rain. Bare ground or only a light snow cover prevailed in southern New England from the middle of January to about February 5, when substantial snowfall occurred in the Berkshires, and about two weeks later over all sections. There was a notable absence of heavy gales. March, however, produced an extraordinary snowfall in southern Vermont and western Massachusetts from the 2d to the 5th. As much as 50 inches fell during this storm, with a total depth of 80 inches on the ground on the evening of the 5th in the Deerfield Valley. Small communities in the area were isolated for several days. Northeast gales which attended this storm along the coast, accompanied by high tides and heavy surf, caused heavy damage along shore. By the end of March the snow cover had receded to the highlands of the three northern states of the section. The latter half of the month was sunny and dry, favoring preparatory out-of-door activities. In April, however, inadequate sunshine and warmth and too wet soil retarded agriculture. Frequent heavy frosts occurred over much of the Section until near the end of the month; and in Boston, the last killing frost on the 28th was about 11 days later than the average date. In May this pattern persisted until soon after the middle of the month, except for an outstanding two-day heat wave on the 12th and 13th. Heavy to killing frosts occurred generally in the interior as late as the 16th, damaging fruit blooms in low orchards and early gardens. June was uneventful from a climatological viewpoint. Too frequent and heavy rainfalls, particularly in the three northern states, continued to retard general crop development until the last five days, when warmth and sunshine were beneficial. In Vermont, the heavy rains of the 2-3d caused collapse of a dam, flooding the lower

(Continued on page 102)

The average annual mean temperature for the Section was 46.3°, which is 0.4° above the mean for the past 60 years. The average temperature for the northern division was 43.8°; for the southern division 48.9°. The highest annual mean temperature was 51.9° at Providence, R. I.; the lowest was 37.5° at First Connecticut Lake, N. H. The highest temperature reported was 99° at several stations on August 13, 15 and 24; the lowest was −32° at Fort Kent, Me., on January 4. The annual range for New England was 131°; the greatest local annual range was 126° at Fort Kent and Vanceboro, Me., the least local annual range was 70° at Nantucket, Mass., and Block Island, R. I.

The average annual precipitation for the Section was 40.62 inches, which is 1.42 inches below the mean for the past 60 years. The average precipitation for the northern division was 39.36 inches; for the southern division 41.75 inches. The average annual snowfall for the northern division was 90.9 inches; for the southern division 57.1 inches; and for the Section 73.5 inches, which is 9.6 inches above the mean for the past 60 years. The greatest annual precipitation was 60.50 inches at Searsburg Mt., Vt.; the least annual amount was 30.21 inches at Jackman, Me. The greatest local monthly amount was 9.34 inches at Lemington, Vt., in May; the least local monthly amount was 0.04 inch at Rumford, Me., in October. The greatest amount in any 24 hours was 5.38 inches at Spot Pond, Mass., on November 11-12. The average number of days with .01 inch or more of precipitation was 121, which is 1 below the mean for the past 60 years.

The prevailing direction of the wind was southwest. The average velocity was 9.7 miles per hour, which is 0.3 mile per hour below the mean. The maximum velocity recorded during the year was 67 miles per hour from the northwest on November 12 at Block Island, R. I.

Sunshine averaged 55% of the possible amount, which is 1 percent above the mean for the past 54 years. Cloudiness was slightly above the mean; the average for the Section was 136 clear, 98 partly cloudy and 131 cloudy days.

COMPARATIVE DATA (Northern: Maine, New Hampshire, and Vermont; Southern: Massachusetts, Rhode Island, and Connecticut).

(Continued from page 97)

parts of Rutland to the extent of $2,000,000 damage. Favorable temperature conditions through July brought rapid response in crop growth, but considerable hail and thunderstorm damage affected several localities, notably the potato fields of Aroostook County, Me., on the 31st. August proved beneficial to agricultural and resort interests alike, warm weather predominating, and rainfall, though deficient, was well distributed. Heatwaves from the 12th to the 15th, and the 23d to 26th produced maximum temperatures equalling or exceeding previous records on several dates. On the 8th, the 15th and the 26th, a number of communities had damage from electrical storms with heavy rains and squalls. During the first 18 days of September, the warm weather cycle persisted, but the sharp change to low temperature starting on the 20th brought the monthly average down to near normal. A new record September low temperature was established for the northern division, 15° on the 27th; and for the southern division, 17°, on the 28th. On both of these dates, the minimum in Boston, 37°, was the lowest of record for the dates. Widespread killing frosts occurred in the northern division in susceptible places on the 20th, and at later dates over the Section, progressively, depending upon exposure, except along the immediate coast. A series of violent thunderstorms, several described as "twisters," passed across southern and central New England on the 2d, doing damage estimated at $20,000,000. Cool weather of the last decade of September carried into a few days of October, but on the 4th there began a period of abnormal warmth that continued almost uninterruptedly through the 29th. During this time rainfall was confined to a few brief light showers. Sunshine was more than abundant, humidity low. These conditions following two previous rather warm, dry months, produced a fire hazard almost unparalleled. Beginning about the 21st a mounting total of fire losses all over eastern, southern and central parts of the Section culminated in a holocaust at Bar Harbor, Me., consuming hundreds of homes, costing 15 lives, and destroying upward of $3,000,000 worth of property, of the more than $30,000,000 losses over the State. Rains beginning on the 29th enabled fire fighters finally to gain control. Besides being the sunniest Fall month of Weather Bureau record, it was by far the warmest, and but for the rain of the last three days would have been the driest. The only prominent meteorological features in November were the coastal storms of the 8th and the 11-12th, both of which lashed the southeast coastal region with gales, high tides and heavy surf, doing more than a million dollars worth of damage. Such storms are characteristic of the season, and the weather in other respects was near normal through the month. December, likewise, produced two coastal storms, these being noteworthy because of the attendant heavy snowfall. During the two days preceding and the two days after Christmas, a total deposit of 24 to 34.5 inches was made along a belt 20 to 30 miles wide extending from northern Essex County southwestward across Middlesex and southern Worcester Counties to northeastern Connecticut. Nearer the coast, accumulations were somewhat less, and regions west of the belt were further away from the storm center. The year ended with a snow blanket in all except southeast coastal regions.

VOL. LX. BOSTON, MASS., JANUARY 1948. No. 1.

GENERAL SUMMARY

The weather of January, 1948, in New England was, in general, a continuation of the severe conditions which had prevailed during the preceding month. Except for a period of slight moderation, from the 1st to the 9th, cold weather predominated, with at least two major snowstorms (17-18th and 24-25th) and frequent occurrences of light to moderate snow. In the southern division, the average total monthly snowfall (31.2 inches) approached record proportions for the month, that amount having been exceeded in but two previous Januarys (1919 and 1923). However, the average total snowfall in the southern division for the season (55.6 inches), including November to the end of January, has never been exceeded there in the records of the Weather Bureau. While minimum temperatures did not approximate record "lows," unusually cold weather occurred with irregular frequency. During the period from the 23d to the end of the month, temperatures were continually below freezing over a large portion of the southern division as well as over the entire northern division. In Boston, on the 25th, average depth of snow on ground measured 22.1 inches. That depth has been exceeded but once, on February 14, 1899, when 23.0 inches of snow on the ground was recorded. At the close of the month, the snow cover blanketed the entire Section, and was, still, of widely varying but unusually high average depth, particularly over the southern division. Maximum depth, from 30 to more than 40 inches, was concentrated over northeastern and east-central Massachusetts away from the immediate coast, a condition similar to that which existed at the end of the preceding month.

TEMPERATURE

The average monthly temperature for the Section, based on 129 records, was 16.7°, which is 5.6° below the mean for the past 61 years. The average temperature for the northern division was 13.1°; for the southern division, 20.6°. The highest monthly mean was 27.8° at Nantucket, Mass.; the lowest was 6.3° at First Connecticut Lake, N.H. The highest recorded was 48° at Block Island, R. I. on the 9th, and Nantucket, Mass. on the 21st; the lowest was −37° at Lemington, Vt. on the 31st. The greatest monthly range was 71° at Chelsea, Vt.; the least was 40° at New Bedford and Provincetown, Mass.

PRECIPITATION

The average monthly precipitation for the Section, based on 196 records, was 3.42 inches, which is 0.01 inch above the mean for the past 61 years. The average precipitation for the northern division was 2.46 inches; for the southern division, 4.32 inches. The greatest monthly amount reported was 7.86 inches at Edgartown, Mass.; the least was 0.91 inch at St. Albans, Vt. The greatest amount in 24 hours was 2.46 inches at Nantucket, Mass. on the 13th. The average number of days with .01 inch or more of precipitation was 12, which is 1 above the mean for the past 61 years.

The average snowfall for the northern division, based on 92 records, was 30.8 inches; for the southern division, based on 91 records, 31.2 inches; for the Section, based on 183 records, 31.0 inches, which is 15.1 inches above the mean for the past 61 years.

WIND, SUNSHINE, CLOUDINESS, AND HUMIDITY

The prevailing direction of the wind, based on 142 records, was northwest. The average velocity, based on the records at 13 stations, was 10.5 miles per hour, which is 0.6 mile per hour below the mean.

The sunshine, based on the records at 12 stations, averaged 42 percent of the possible amount, which is 5 percent below the mean.

Cloudiness was somewhat above the mean. The average for the Section, based on 151 records, was 10 clear, 6 partly cloudy and 15 cloudy days.

The monthly relative humidity, based on the 7:30 a. m. and 7:30 p. m. observations at 13 stations, was 78 percent, which is 1 percent above the mean.

COMPARATIVE DATA (Northern: Maine, New Hampshire, and Vermont; Southern: Massachusetts, Rhode Island, and Connecticut).

Tenths of daily total radiation considered in average.

EXPLANATION OF REFERENCE MARKS

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observations. Maximum and minimum temperatures recorded at this time are nearly always correct for the date on which they are recorded. The departures from the normal temperature and precipitation are computed from the averages of the entire period through 1940 for stations having 10 or more years of record. Reference letters ^{a}, ^{b}, ^{c}, etc. appearing in the table indicate number of days missing; for example, ^{b} represents two days, etc.

† Post-office addresses of these stations are as follows: Maine — Brassua Dam, Rockwood: Hiram, West Baldwin. Ripogenus Dam, Millinocket: Winslow, Waterville: — New Hampshire – First Connecticut Lake, Pittsburg: New Durham, Alton; Pinkham Notch, Gorham: York Pond, Berlin: — Vermont – Bloomfield, North Stratford, N. H.; Cornwall, Middlebury: Mays Mill, Colrain, Mass.: Searsburg Station, Wilmington: Somerset, Wilmington: Vernon, Shelburne Falls, Mass.: – Massachusetts – Ashland, Framingham: Blue Hill, Milton: Lake Cochituate, Framingham: Connecticut – Cream Hill, West Cornwall: Middletown, Rockfall.

†† Not included in summaries ††† Observer for New England Power Co. T Trace, precipitation is less than .01 inch rain or melted snow.

* Precipitation included in that of next measurement. ** Record furnished by Massachusetts Department of Public Health: precipitation measured in morning

‖ Observations taken in morning: maximum then read is charged to preceding day on which it almost always occurs. § Also on other dates recorded as of preceding date. ‡ Precipitation measured with recording gage. ‡‡ Observation taken at 1.30 a. m., recorded as of preceding day.

[1] Regular Weather Bureau station; precipitation and temperature are for 24 hour period, midnight to midnight. [2] Precipitation measured in morning: amount recorded is for preceding 24 hours (ending on date entered). [3] Thermometers not supplied by Weather Bureau. [4] Precipitation measured in morning recorded as of preceding date. [5] Observations irregular.

Daily Precipitation for January 1948

VOL. LX. BOSTON, MASS., FEBRUARY 1948. NO. 2.

GENERAL SUMMARY

Hard freezing weather, which had marked the closing week of the preceding month, persisted through the first eleven days of February, 1948, and was attended by frequent light snowfalls. This substantially maintained the deep snow cover, generally, throughout the Section, only slight reduction resulting from settling and evaporation. The first widespread and appreciable rainfall in almost two months occurred on the 13-14th, accompanied by an extended period of thawing weather, also the first since mid-December, which continued to the 20th. This combination produced a rapid and marked reduction of the snow cover, and, for a few days around the 20th and 21st, and 26th and 27th, large areas of bare ground were in evidence for the first time since the latter part of December. The early and continuous snow cover through the winter had prevented deep penetration of frost, so that ground absorption of melted snow and rain was accomplished without noticeable flood effect on rivers, lakes, etc. The near absence of ground frost at this time of year is a condition probably without parallel in New England. A substantial snowstorm on the 28-29th occurred over most of the Section except extreme northern Maine, and produced depths averaging about 4 to 8 inches over eastern portions and greater amounts farther west, with a peak of more than 15 inches in parts of the Berkshires. The month was the 4th in a series of cold months, each of which has averaged considerably below normal in temperature. It also marked the 3d consecutive month in which the average total snowfall in the southern division was greater than that in the northern division, a unique occurrence in the history of New England weather. In three months of the meteorological winter (December through February), average total snowfall in the southern division (70.2 inches) was more than has ever been recorded there in any comparable period of record. The corresponding total in the northern division was 64.4 inches. Normal totals for the southern and northern divisions are 34.3 inches and 54.3 inches, respectively. Average total precipitation in both divisions for the same three months was, surprisingly, appreciably below normal. This is accounted for by the abnormally high percentage of precipitation which occurred in the form of snow. E. S.

TEMPERATURE

The average monthly temperature for the Section, based on 129 records, was 18.9°, which is 3.7° below the mean for the past 61 years. The average temperature for the northern division was 14.4°; for the southern division, 23.8°. The highest monthly mean was 29.2° at three coastal stations in Massachusetts and at Block Island, R.I.; the lowest was 4.5° at Fort Kent, Me. The highest recorded was 56° at Northfield, Vt. on the 14th, Waterbury, Conn., on the 17th and Westbrook, Conn., on the 18th; the lowest was −41° at First Connecticut Lake, N.H., on the 10th. The greatest monthly range was 90° at Enosburg Falls, Vt.; the least was 40° at Provincetown, Mass.

PRECIPITATION

The average monthly precipitation for the Section, based on 196 records, was 2.06 inches, which is 0.98 inch below the mean for the past 61 years. The average precipitation for the northern division was 1.78 inches; for the southern division, 2.32 inches. The greatest monthly amount reported was 4.36 inches at Whitingham, Vt.; the least was 0.63 inch at Bangor, Me. The greatest amount in 24 hours was 1.82 inches at Mays Mills, Vt., on the 28th-29th. The average number of days with .01 inch or more of precipitation was 9, which is the mean for the past 61 years.

The average snowfall for the northern division, based on 91 records, was 14.0 inches; for the southern division, based on 92 records, 15.8 inches; for the Section, based on 183 records, 14.9 inches, which is 1.6 inches below the mean for the past 61 years.

WIND, SUNSHINE, CLOUDINESS, AND HUMIDITY

The prevailing direction of the wind, based on 141 records, was northwest. The average velocity, based on the records at 13 stations, was 10.2 miles per hour, which is 1.8 miles per hour below the mean.

The sunshine, based on the records at 13 stations, averaged 53 percent of the possible amount, which is 2 percent above the mean.

Cloudiness was near the mean. The average for the Section, based on 147 records, was 11 clear, 8 partly cloudy and 10 cloudy days.

The monthly relative humidity, based on the 7:30 a. m. and 7:30 p. m. observations at 13 stations, was 75 percent, which is the mean.

COMPARATIVE DATA (Northern: Maine, New Hampshire, and Vermont; Southern: Massachusetts, Rhode Island, and Connecticut).

Tenths of daily total radiation considered in average.

EXPLANATION OF REFERENCE MARKS

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observations. Maximum and minimum temperatures recorded at this time are nearly always correct for the date on which they are recorded. The departures from the normal temperature and precipitation are computed from the averages of the entire period through 1940 for stations having 10 or more years of record. Reference letters ^{a}, ^{b}, ^{c}, etc. appearing in the table indicate number of days missing; for example, ^{b} represents two days, etc.

† Post-office addresses of these stations are as follows: Maine — Brassua Dam, Rockwood; Hiram, West Baldwin; Ripogenus Dam, Millinocket; Winslow, Waterville; — New Hampshire — First Connecticut Lake, Pittsburg; New Durham, Alton; Pinkham Notch, Gorham; York Pond, Berlin; — Vermont — Bloomfield, North Stratford, N. H.; Cornwall, Middlebury; Mays Mill, Colrain, Mass.; Searsburg Station, Wilmington; Somerset, Wilmington; Vernon, Shelburne Falls, Mass.; — Massachusetts — Ashland, Framingham; Blue Hill, Milton; Lake Cochituate, Framingham; — Connecticut — Cream Hill, West Cornwall; Middletown, Rockfall.

‖ Not included in summaries ††† Observer for New England Power Co. T Trace, precipitation is less than .01 inch rain or melted snow.

* Precipitation included in that of next measurement. ** Record furnished by Massachusetts Department of Public Health: precipitation measured in morning

¶ Observations taken in morning: maximum then read is charged to preceding day on which it almost always occurs. § Also on other dates. recorded as of preceding date. ‡ Precipitation measured with recording gage. ‡‡ Observation taken at 1.30 a. m., recorded as of preceding day.

[1] Regular Weather Bureau station; precipitation and temperature are for 24 hour period, midnight to midnight. [2] Precipitation measured in morning; amount recorded is for preceding 24 hours (ending on date entered). [3] Thermometers not supplied by Weather Bureau. [4] Precipitation measured in morning recorded as of preceding date. [5] Observations irregular.

Daily Precipitation for February 1948

VOL. LX. BOSTON, MASS., MARCH 1948. NO. 3.

GENERAL SUMMARY

The first two weeks of March, 1948, in New England were cold and wintry. The 5th and 6th were the coldest days during this period, and record low temperatures for March were recorded at many stations on those dates. Nearly all of the total snowfall of the month occurred during this period, with monthly amounts generally above normal throughout the Section, and substantially so in the southern division. Storms on the 2-3d and 11th accounted for the major portion of monthly snowfall totals. The temperature pattern changed abruptly on the 15th from very cold to pleasantly mild, above-normal readings which continued nearly unbroken to the end of the month. The accumulated temperature excess during this period was sufficient, in the southern division, to overbalance the deficiency of the first two weeks, but for the Section as a whole, the average monthly temperature was a fraction of a degree below normal. The snow cover was gone over most of the southern division shortly after mid-month except in parts of the Berkshires where traces still remained at the close of the month. In the northern division at the close of the month, the snow cover remained over much of northern Maine, extreme northern New Hampshire and in the mountains of New Hampshire and Vermont, with depths ranging to more than 10 inches in favorable places. Rivers and streams reached above bankfull stages about the 22d and remained at high levels to the end of the month. No major flood damage was reported. E. S.

TEMPERATURE

The average monthly temperature for the Section, based on 125 records, was 31.9°, which is 0.5° below the mean for the past 61 years. The average temperature for the northern division was 28.2°; for the southern division, 36.0°. The highest monthly mean was 39.4° at Providence, R. I.; the lowest was 17.9° at Caribou, Me. The highest recorded was 76° at Westbrook, Conn. on the 22d; the lowest was −32° at First Connecticut Lake, N.H. and Lemington, Vt. on the 6th. The greatest monthly range was 98° at Lemington, Vt.; the least was 49° at Nantucket, Mass.

PRECIPITATION

The average monthly precipitation for the Section, based on 196 records, was 3.20 inches, which is 0.40 inch below the mean for the past 61 years. The average precipitation for the northern division was 2.71 inches; for the southern division, 3.66 inches. The greatest monthly amount reported was 5.67 inches at Somerset, Vt.; the least was 1.54 inches at New Castle, N. H. The greatest amount in 24 hours was 1.65 inches at Lincoln, N. H. on the 19-20th. The average number of days with .01 inch or more of precipitation was 12, which is 1 above the mean for the past 61 years.

The average snowfall for the northern division, based on 89 records, was 15.3 inches; for the southern division, based on 90 records, 12.0 inches; for the Section, based on 179 records, 13.6 inches, which is 2.5 inches above the mean for the past 61 years.

WIND, SUNSHINE, CLOUDINESS, AND HUMIDITY

The prevailing direction of the wind, based on 143 records, was northwest. The average velocity, based on the records at 13 stations, was 10.8 miles per hour, which is 0.9 mile per hour below the mean.

The sunshine, based on the records at 13 stations, averaged 51 percent of the possible amount, which is 2 percent below the mean.

Cloudiness was slightly above the mean. The average for the Section, based on 149 records, was 11 clear, 7 partly cloudy and 13 cloudy days.

The monthly relative humidity, based on the 7:30 a. m. and 7:30 p. m. observations at 13 stations, was 76 percent, which is 2 percent above the mean.

COMPARATIVE DATA (Northern: Maine, New Hampshire, and Vermont; Southern: Massachusetts, Rhode Island, and Connecticut).

Tenths of daily total radiation considered in average.

EXPLANATION OF REFERENCE MARKS

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observations. Maximum and minimum temperatures recorded at this time are nearly always correct for the date on which they are recorded. The departures from the normal temperature and precipitation are computed from the averages of the entire period through 1940 for stations having 10 or more years of record. Reference letters a, b, c, etc. appearing in the table indicate number of days missing; for example, b represents two days, etc.

† Post-office addresses of these stations are as follows: Maine – Brassua Dam, Rockwood; Hiram, West Baldwin; Ripogenus Dam, Millinocket; Winslow, Waterville; – New Hampshire – First Connecticut Lake, Pittsburg; New Durham, Alton; Pinkham Notch, Gorham; York Pond, Berlin; – Vermont – Bloomfield, North Stratford, N. H.; Cornwall, Middlebury; Mays Mill, Colrain, Mass.; Searsburg Station, Wilmington; Somerset, Wilmington; Vernon, Shelburne Falls, Mass.; – Massachusetts – Ashland, Framingham; Blue Hill, Milton; Lake Cochituate, Framingham; – Connecticut – Cream Hill, West Cornwall; Middletown, Rockfall.

†† Not included in summaries. ††† Observer for New England Power Co. T. Trace, precipitation is less than .01 inch rain or melted snow.

• Precipitation included in that of next measurement. ** Record furnished by Massachusetts Department of Public Health; precipitation measured in morning.

‖ Observations taken in morning; maximum then read is charged to preceding day on which it almost always occurs. § Also on other dates.

‡ Precipitation measured with recording gage. ‡‡ Observation taken at 1.30 a. m., recorded as of preceding day.

recorded as of preceding date.

[1] Regular Weather Bureau station; precipitation and temperature are for 24 hour period, midnight to midnight. [2] Precipitation measured in morning; amount recorded is for preceding 24 hours (ending on date entered). [3] Thermometers not supplied by Weather Bureau. [4] Precipitation measured in morning recorded as of preceding date.

[5] Observations irregular.

Daily Precipitation for March 1948

VOL. LX. BOSTON, MASS., APRIL 1948. NO. 4.

GENERAL SUMMARY

April, 1948, in New England was the first month of above normal average temperature, though only fractionally so, for the Section as a whole since October, 1947. The number of days of above normal and subnormal temperature was about evenly divided, with the former predominating during the first half of the month. Extremes of temperature, which often occur in the month of April, were lacking, and those of this month hardly approached record readings. Killing frosts or subfreezing temperatures were recorded at most stations as late as the 28th, and at the more susceptible places, on the 29th and 30th. A few places in the southern division recorded last killing frost on the 18th. No damage to early fruit buds was reported. While monthly totals of precipitation were generally slightly above normal, most of it came during the first half of the month, so that, at the close of the month, rainfall was needed for agriculture and the forest fire hazard was increasing. Snowfall was mostly light and unimportant throughout the Section, with the last general measurable occurrence in the northern division on the 14th. In the southern division, hardly more than a trace was recorded during the month, except in northern portions of the Berkshires where amounts mostly less than an inch were recorded. Frequency of precipitation and average cloudiness were both slightly above normal. At the close of the month, the predominant needs were rain and warmth.

TEMPERATURE

The average monthly temperature for the Section, based on 118 records, was 44.1°, which is 0.5° above the mean for the past 61 years. The average temperature for the northern division was 42.0°; for the southern division, 46.4°. The highest monthly mean was 50.0° at Springfield, Mass; the lowest was 35.6° at Caribou, Me. The highest recorded was 78° at Cavendish, Vt. on the 20th; the lowest was 9° at First Connecticut Lake, N.H. on the 11th. The greatest monthly range was 66° at Dorset, Vt.; the least was 28° at Nantucket, Mass. and Block Island, R. I.

PRECIPITATION

The average monthly precipitation for the Section, based on 191 records, was 3.27 inches, which is 0.07 inch below the mean for the past 61 years. The average precipitation for the northern division was 3.03 inches; for the southern division, 3.50 inches. The greatest monthly amount reported was 5.91 inches at Pinkham Notch, N.H.; the least was 1.62 inches at East Barnet, Vt. The greatest amount in 24 hours was 3.00 inches at Mt. Carmel, Conn. on the 1st. The average number of days with .01 inch or more of precipitation was 11, which is 1 above the mean for the past 61 years.

The average snowfall for the northern division, based on 90 records, was 3.7 inches; for the southern division, based on 91 records, 0.1 inch; for the Section, based on 181 records, 1.9 inches, which is 2.1 inches below the mean for the past 61 years.

WIND, SUNSHINE, CLOUDINESS, AND HUMIDITY

The prevailing direction of the wind, based on 134 records, was northwest. The average velocity, based on the records at 13 stations, was 11.1 miles per hour, which is the mean.

The sunshine, based on the records at 13 stations, averaged 52 percent of the possible amount, which is 2 percent below the mean.

Cloudiness was slightly above the mean. The average for the Section, based on 142 records, was 10 clear, 7 partly cloudy and 13 cloudy days.

The monthly relative humidity, based on the 7:30 a. m. and 7:30 p. m. observations at 13 stations, was 69 percent, which is 2 percent above the mean.

COMPARATIVE DATA (Northern: Maine, New Hampshire, and Vermont; Southern: Massachusetts, Rhode Island, and Connecticut).

Dates of Miscellaneous Phenomena

Auroras.—14th, 21st, 22d, 29th.

Halos, lunar.—18th, 19th, 23d, 24th.

Halos, solar.—5th, 7th, 11th, 13th, 15th, 16th, 19th, 23-25th, 28th.

Hail.—1st, Cavendish, Vt.; 8th, Old Town, Me.; 9th, Bennington, Vt. and Haverhill, Springfield, Sterling and Westover Field, Mass.; 13th, Hyannis, Mass.; 21st, Woodland, Me. and Bennington, Vt.; 30th, Greenville, Me., Amherst, Mass. and Cream Hill and Norfolk, Conn.

Thunderstorms.—1st, 6th, 8th, 9th, 12th, 14th, 20th, 21st, 30th.

Fog, dense.—1st, 2d, 6-9th, 11-17th, 20-22d, 27th, 30th.

Frosts.—(dates of last killing or last occurrence of 32° or lower temperature during month)—Generally from 26th through 30th, depending upon susceptibility of location (most frequent on 28th and 29th); at a few less susceptible places in the southern division on the 18th.

Sleet.—(date, division, number of stations reporting; N-northern division, S-southern division)—2d, N1, S1; 3d, N2; 9th, N2; 11th, N11, S3; 12th, N3; 13th, S3; 14th, N15, S28; 15th, N4, S1; 16th, N1; 17th, N1; 20th, N1; 21st, N4; 27th, N1; 29th, N1; 30th, N1, S1.

NOTE: Observations taken at 7:30 a. m. E S.T.

EXPLANATION OF REFERENCE MARKS

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observations. Maximum and minimum temperatures recorded at this time are nearly always correct for the date on which they are recorded. The departures from the normal temperature and precipitation are computed from the averages of the entire period through 1940 for stations having 10 or more years of record. Reference letters ^{a}, ^{b}, ^{c}, etc. appearing in the table indicate number of days missing; for example, ^{b} represents two days, etc.

† Post-office addresses of these stations are as follows: Maine — Brassua Dam, Rockwood; Hiram, West Baldwin; Ripogenus Dam, Millinocket; Winslow, Waterville; — New Hampshire — First Connecticut Lake, Pittsburg; New Durham, Alton; Pinkham Notch, Gorham: York Pond, Berlin; — Vermont — Bloomfield, North Stratford, N. H.; Cornwall, Middlebury; Mays Mill, Colrain, Mass.; Searsburg Station, Wilmington; Somerset, Wilmington; Vernon, Shelburne Falls, Mass.: — Massachusetts — Ashland, Framingham; Blue Hill, Milton; Lake Cochituate, Framingham; — Connecticut — Cream Hill, West Cornwall; Middletown, Rockfall.

†† Not included in summaries ††† Observer for New England Power Co. T. Trace, precipitation is less than .01 inch rain or melted snow.

* Precipitation included in that of next measurement. ** Record furnished by Massachusetts Department of Public Health; precipitation measured in morning

‖ Observations taken in morning; maximum then read is charged to preceding day on which it almost always occurs. § Also on other dates.

recorded as of preceding date. ‡ Precipitation measured with recording gage. ‡‡ Observation taken at 1.30 a. m., recorded as of preceding day.

[1] Regular Weather Bureau station; precipitation and temperature are for 24 hour period, midnight to midnight. [2] Precipitation measured in morning; amount recorded is for preceding 24 hours (ending on date entered). [3] Thermometers not supplied by Weather Bureau. [4] Precipitation measured in morning recorded as of preceding date.

[5]Observations irregular.

Daily Precipitation for April 1948

VOL. LX. BOSTON, MASS., MAY 1948. NO. 5.

GENERAL SUMMARY

Chill northeast winds, frequent and substantial rainfall, subnormal temperature and excessive cloudiness predominated in New England during May, 1948. The month was the fourth in a series of cold and rainy Mays. Monthly rainfall totals were unusually heavy, generally, through the Section, with greatest amounts in excess of 10 inches recorded at a few stations in southeastern Massachusetts and Rhode Island. Sunshine averaged only 39 percent of the possible amount and there were 18 cloudy days, as compared with normals of 55 percent and 11 days, respectively. With but few breaks, temperatures were persistently below normal. All outdoor activities were unfavorably affected. Agriculture was especially hard-hit by the continued lack of adequate sunshine and warmth, and much rotting of early planted seeds was reported. Widespread killing frosts on the 2d and 4th were of little consequence due to the backwardness of the season which was reportedly about 2 weeks late at the close of the month. At Boston, the month was the first May since 1901 in which the prevailing wind direction was northeast. Thunderstorms occurred with, perhaps, greater than usual frequency, being reported at some part of the Section on 19 days of the month. At the close of the month, there was a definite need for sunshine and warmth for the benefit of many other seasonal interests as well as agriculture. E.S.

TEMPERATURE

The average monthly temperature for the Section, based on 119 records, was 53.0°, which is 2.1° below the mean for the past 61 years. The average temperature for the northern division was 51.0°; for the southern division, 55.2°. The highest monthly mean was 59.4° at Springfield, Mass; the lowest was 45.8° at Eastport, Me. The highest recorded was 90° at Waterbury, Conn. on the 12th; the lowest was 22° at Lemington, Vt. on the 4th. The greatest monthly range was 61° at Waterbury, Conn.; the least was 31° at New Bedford, Mass. and Block Island, R. I.

PRECIPITATION

The average monthly precipitation for the Section, based on 193 records, was 6.49 inches, which is 3.01 inches above the mean for the past 61 years. The average precipitation for the northern division was 6.03 inches; for the southern division, 6.94 inches. The greatest monthly amount reported was 10.44 inches at Wood River Junction, R.I.; the least was 2.97 inches at Montpelier, Vt. The greatest amount in 24 hours was 4.00 inches at Augusta, Me. on the 17-18th. The average number of days with .01 inch or more of precipitation was 17, which is 6 above the mean for the past 61 years.

The average snowfall for the northern division, based on 91 records, was 0.3 inch; for the southern division based on 98 records, a trace; for the Section, based on 189 records, 0.1 inch, which is 0.2 inch below the mean for the past 61 years.

WIND, SUNSHINE, CLOUDINESS, AND HUMIDITY

The prevailing direction of the wind, based on 135 records, was south. The average velocity, based on the records at 13 stations, was 9.4 miles per hour, which is 0.9 mile per hour below the mean.

The sunshine, based on the records at 12 stations, averaged 39 percent of the possible amount, which is 16 percent below the mean.

Cloudiness was decidedly above the mean. The average for the Section, based on 142 records, was 6 clear, 7 partly cloudy and 18 cloudy days.

The monthly relative humidity, based on the 7:30 a. m. and 7:30 p. m. observations at 13 stations, was 80 percent, which is 4 percent above the mean.

COMPARATIVE DATA (Northern: Maine, New Hampshire, and Vermont; Southern: Massachusetts, Rhode Island, and Connecticut).

Dates of Miscellaneous Phenomena

Auroras.—2d, 5th, 15th, 16th.

Halos, lunar.—None.

Halos, solar.—1st, 3d, 5th, 6th, 9-11th.

Hail.—12th, Hanover and Plymouth, N. H., Danbury and Warren, Conn.; 14th, Randolph, N. H.; 15th, Gardiner, Me.; 17th, Lakeport, N. H., Pittsfield and Stockbridge, Mass.; 18th, Haverhill and Pittsfield, Mass., Putnam, Conn.; 21st, Pittsfield and Stockbridge, Mass., Norfolk and Norwalk, Conn.; 22d, Bridgeport and Warren, Conn.; 29th, Springfield, Mass.

Thunderstorms.—7th, 8th, 11th, 12th, 14th, 16-19th, 21st-26th, 28th-31st.

Sleet.—1st, Randolph, N. H.; 2d, Houlton and Millinocket Dam, Me.; 14th, Eastport, Me., Pinkham Notch and Randolph, N. H., Lemington, Vt.

Fog, dense.—2d-5th, 7-19th, 21st, 22d, 24th-31st.

Frosts.—(latest killing or latest date of freezing temperature in month)—Northern Division: Occurred generally, except in Lake Champlain region and sheltered places of extreme southeast, on 2d-6th, 16th or 21st, progressively, depending upon susceptibility of location. Southern Division: Occurred only in susceptible places on 2d or 4th, and on 16th in valleys of Berkshires. Elsewhere in Section, last killing frost occurred in April.

Earthquake.—At Westerly, R. I. and vicinity on 13th at 9:23 p. m., E. S. T.; 45 seconds duration; no damage.

NOTE: Observations taken at 7:30 a. m. E S.T.

EXPLANATION OF REFERENCE MARKS

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observations. Maximum and minimum temperatures recorded at this time are nearly always correct for the date on which they are recorded. The departures from the normal temperature and precipitation are computed from the averages of the entire period through 1940 for stations having 10 or more years of record. Reference letters ^{a}, ^{b}, ^{c}, etc. appearing in the table indicate number of days missing; for example, ^{b} represents two days, etc.

† Post-office addresses of these stations are as follows: Maine — Brassua Dam, Rockwood; Hiram, West Baldwin; Ripogenus Dam, Millinocket; Winslow, Waterville; — New Hampshire — First Connecticut Lake, Pittsburg; New Durham, Alton; Pinkham Notch, Gorham: York Pond, Berlin; — Vermont — Bloomfield, North Stratford, N. H; Cornwall, Middlebury; Mays Mill, Colrain, Mass.; Searsburg Station, Wilmington; Somerset, Wilmington; Vernon, Shelburne Falls, Mass.: — Massachusetts — Ashland, Framingham; Blue Hill, Milton; Lake Cochituate, Framingham; — Connecticut — Cream Hill, West Cornwall; Middletown, Rockfall.

†† Not included in summaries ††† Observer for New England Power Co. T. Trace, precipitation is less than .01 inch rain or melted snow.

* Precipitation included in that of next measurement. ** Record furnished by Massachusetts Department of Public Health; precipitation measured in morning recorded as of preceding date.

‖ Observations taken in morning: maximum then read is charged to preceding day on which it almost always occurs. § Also on other dates.

‡ Precipitation measured with recording gage. ‡‡ Observation taken at 1.30 a. m., recorded as of preceding day.

[1] Regular Weather Bureau station; precipitation and temperature are for 24 hour period, midnight to midnight. [2] Precipitation measured in morning; amount recorded is for preceding 24 hours (ending on date entered). [3] Thermometers not supplied by Weather Bureau. [4] Precipitation measured in morning recorded as of preceding date. [5] Observations irregular.

Daily Precipitation for May 1948

JUNE 1948

Volume LX No. 6

NEW YORK CITY: 1948

ACKNOWLEDGMENTS

In addition to the climatological data from some 6,000 Weather Bureau and cooperative weather stations, this bulletin series contains records from Hydroclimatic Network Stations which were formerly reproduced in the Hydrologic Bulletin Series. The Hydroclimatic Network is a nationwide net of rain gages -- mostly of the recording type which produce continuous records of precipitation. It was established in 1939 at the request of the Corps of Engineers, Department of the Army, to supplement existing precipitation stations in order to provide records of rainfall intensity which were essential to the planning of flood control and related works by the Corps of Engineers. This Network, now numbering about 2,000 recording, and 1,000 non-recording rain gages, has been maintained by the Weather Bureau through working funds transferred annually to the Weather Bureau by the Corps of Engineers. These transfers averaged about $250,000 per year between 1940 and 1944, and nearly $375,000 since that date. For the years 1940-42, the Department of Agriculture transferred about $100,000 per year to provide data required in its work, and since 1947 the Bureau of Reclamation has transferred about $25,000 per year to meet the increasing needs of their program in the Western States.

Previous to the introduction of this bulletin series, data from Hydroclimatic Network stations were presented in bulletins (Hydrologic Bulletins) which were issued monthly for each of 8 drainage areas embracing the entire United States, but since the Network was established to meet the internal requirements of the Federal agencies referred to above, no provision was made for public dissemination of the data, distribution being limited to cooperating agencies and to certain public repositories. A list of locations where reference copies of the Hydrologic Bulletin Series are available for inspection may be obtained upon application to Chief, U.S. Weather Bureau, Washington 25, D.C.

Many other records published in this bulletin have been made available through the cooperation of various public offices, private agencies, and individuals as listed in the Station Index.

NEW ENGLAND - JUNE 1948

W.H. Tracy, Section Director - Boston, Mass.

GENERAL SUMMARY

The frequent on-shore winds and general showers that dominated the weather during May continued their influence through the first two weeks of June, retarding the normal progress of vegetation and bringing discouragement to seasonal business. No definite or general improvement occurred until the final week. Except in northern Maine frequent rains and lack of sunshine delayed the usual agricultural activities. Only grass and pasture lands and crops in light soils throve. There were marked contrasts in precipitation totals, varying from substantial deficiencies in most northern interior parts to greatly excessive amounts in central and western parts of Massachusetts and Connecticut. There was more than the usual frequency of thunderstorms but few were of serious nature. On the 24th, however, showers that accompanied the eastward passage of a warm front brought a series of heavy down-pours and severe wind-squalls. The hardest hit area was around St. Johnsbury, Vt., where it was termed the most severe since the 1938 hurricane, damaging roofs, trees, wires and windows. The same storm apparently struck with undiminished fury against the Franconia Range in New Hampshire, where the excessive rainfall loosened the soil and set off two landslides down the slope of Mt. Lafayette, one burying the highway for 350 feet, and barring traffic for several days. The month's copious rains, following an extremely wet May maintained above-normal stream flow and water supplies. The closing week brought some much needed sunshine and warmth, accelerating the growth of backward crops, and presaging near normal harvest.

M.T.N.

TEMPERATURE

The average monthly temperature for the Section, based on 145 records, was 61.4°, which is 2.6° below the mean for the past 61 years. The average temperature for the northern division was 60.0°; for the southern division, 63.2°. The highest monthly mean was 67.4° at Waterbury, Conn.; the lowest was 53.6° at Eastport, Me. The highest recorded was 97° at Waterbury, Conn. on the 29th and at Framingham, Mass. on the 30th; the lowest was 28° at Lemington, Vt. on the 6th. The greatest monthly range was 64° at Lemington, Vt.; the least was 28° at Nantucket, Mass.

PRECIPITATION

The average monthly precipitation for the Section, based on 379 records, was 4.25 inches, which is 0.70 inch above the mean for the past 61 years. The average precipitation for the northern division was 3.39 inches; for the southern division, 5.16 inches. The greatest monthly amount reported was 10.32 inches at Pittsfield, Mass.; the least was 0.84 inch at Moosehead, Me. The greatest amount in 24 hours was 2.68 inches at Pittsfield, Mass. on the 24th. The average number of days with .01 inch or more of precipitation was 13, which is 2 above the mean for the past 61 years.

The following reference notes apply only to Table 7 - Daily River Stages:

Readings are made at approximately 7 a.m. (local time). They are provisional and subject to correction. Final and corrected stages will be published in the annual publication "Daily River Stages - Principal Rivers of the United States".

a	Obstructed by rough ice.	e	Ice gorge below gage.
b	Frozen but open at gage.	f	Shore ice.
c	Upper surface of smooth ice.	g	Floating ice.
d	Ice gorge aboce gage.	h	Pool stage.

REFERENCE NOTES

e four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers thin a state.

layed data and corrections will be carried only in the June and December issues of this bulletin.

ta in Tables 3, 5 and 6 are for the 24 hours ending at time of observation. See the Station Index for observation time.

-	No record.
+	And also on later dates.
*	Amount included in following measurement, time distribution unknown.
//	Gage is equipped with a windshield.
6	Precipitation measured at 6-hourly intervals, no recording gage.
a, b, c through i.	Number of days missing. a indicates one day missing, b indicates two days missing, etc.
ar	This entry in time of observation column in Station Index means after rain.
ss	This entry in time of observation column in Station Index means sunset.
k	Total includes snow which accumulated in collar of gage during previous period and fell into gage for this measurement.
r	Station equipped with recording gage only. All amounts in Table 3 are from non-recording gages, except for stations with this reference.
x	Daily totals are for the 24 hours ending at 1:30 A.M., E.S.T., of the following day.
z	Hourly amounts from recording gage at the same site may be found in Table 4.
T	Trace, amount too small to measure.

ta in Table 4 were formerly published in the Hydrologic Bulletin for North Atlantic District. Amounts in this table are from recording gages. aces are not shown.

CLIMATOLOGICAL DATA

NEW ENGLAND

JULY 1948

Volume LX No. 7

NEW YORK CITY: 1948

ACKNOWLEDGMENTS

In addition to the climatological data from some 6,000 Weather Bureau and cooperative weather stations, this bulletin series contains records from Hydroclimatic Network Stations which were formerly reproduced in the Hydrologic Bulletin Series. The Hydroclimatic Network is a nationwide net of rain gages -- mostly of the recording type which produce continuous records of precipitation. It was established in 1939 at the request of the Corps of Engineers, Department of the Army, to supplement existing precipitation stations in order to provide records of rainfall intensity which were essential to the planning of flood control and related works by the Corps of Engineers. This Network, now numbering about 2,000 recording, and 1,000 non-recording rain gages, has been maintained by the Weather Bureau through working funds transferred annually to the Weather Bureau by the Corps of Engineers. These transfers averaged about $250,000 per year between 1940 and 1944, and nearly $375,000 since that date. For the years 1940-42, the Department of Agriculture transferred about $100,000 per year to provide data required in its work, and since 1947 the Bureau of Reclamation has transferred about $25,000 per year to meet the increasing needs of their program in the Western States.

Previous to the introduction of this bulletin series, data from Hydroclimatic Network stations were presented in bulletins (Hydrologic Bulletins) which were issued monthly for each of 8 drainage areas embracing the entire United States, but since the Network was established to meet the internal requirements of the Federal agencies referred to above, no provision was made for public dissemination of the data, distribution being limited to cooperating agencies and to certain public repositories. A list of locations where reference copies of the Hydrologic Bulletin Series are available for inspection may be obtained upon application to Chief, U.S. Weather Bureau, Washington 25, D.C.

Many other records published in this bulletin have been made available through the cooperation of various public offices, private agencies, and individuals as listed in the Station Index.

NEW ENGLAND - JULY 1948

W. H. Tracy, Section Director - Boston, Mass.

GENERAL SUMMARY

The weather conditions in July, 1948 were rather uneventful, but considerably more favorable for agriculture than in the spring and early summer, enabling backward crops to recover from early deficiencies. Abundant sunshine and a persistence of warm days without dessicating heat-waves promoted rapid growth and stimulated summer recreational business which had likewise been retarded by an unpleasant June. Rainfall, though rather frequent, was mostly at night. Severe electrical storm damage was mostly confined to south-eastern parts of the Section on the 5th and 6th. Many buildings were struck by lightning, and considerable hail damage occurred in the Connecticut Valley tobacco fields. Very heavy down-pours occurred, especially in southern New Hampshire, Windham station reporting 3.25 inches within 2 hours. Hail, too, caused damage in east-central Aroostook County, Me., on the 11th: north of Houlton, stones fell ranging up to two inches in diameter. Standing hay crops were lodged in these storms and in others that were locally heavy on the 13th and from the 21st through the 28th. The erratic qualities of summer storms were evident in the wide variation in monthly precipitation totals, ranging from 0.99 inch at Sunday River in western Maine to over 7.00 inches on the eastern Maine coast and as high as 8.00 inches in central Massachusetts, despite the fact that the over-all average was close to normal. At the close of the month crops were in excellent shape and grass and pasture lands retained their lush greenness to an extent unusual in mid-summer. Some areas in the central part of the Section began to need rain, however, and storage lakes in Washington County, Me., fell to very low levels.

M.T.N.

TEMPERATURE

The average monthly temperature for the Section, based on 147 records, was 69.6°, which is 0.5° above the mean for the past 61 years. The average temperature for the northern division was 68.0°; for the southern division, 71.5°. The highest monthly mean was 76.0° at Providence, R.I.; the lowest was 58.8° at Tuckerman Ravine, N. H. The highest recorded was 97° at Bellows Falls, Vt. and Brockton, Mass. on the 13th; the lowest was 37° at First Connecticut Lake, N.H. on the 7th. The greatest monthly range was 53° at South Andover, Me.; the least was 28° at Block Island, R.I.

PRECIPITATION

The average monthly precipitation for the Section, based on 374 records, was 3.48 inches, which is 0.29 inch below the mean for the past 61 years. The average precipitation for the northern division was 3.09 inches; for the southern division, 3.90 inches. The greatest monthly amount reported was 8.00 inches at Hardwick, Mass; the least was 0.99 inch at Sunday River, Me. The greatest amount in 24 hours was 4.14 inches at Machias, Me., on the 24th. The average number of days with .01 or more of precipitation was 9, which is 2 below the mean for the past 61 years.
